

GANDHI INSTITUTE OF TECHNOLOGY AND MANAGEMENT (GITAM)
(Deemed to be University, Estd. u/s 3 of UGC Act 1956)
VISAKHAPATNAM *HYDERABAD *BENGALURU
Accredited by NAAC with 'A+' Grade

REGULATIONS AND SYLLABUS

of

M.Sc. Physics

(w.e.f 2021-22 Admitted batch)

Website: www.gitam.edu

Master of Science in Physics (M.Sc Physics)
REGULATIONS
(W.e.f. 2020-21 admitted batch)

1. ADMISSION

1.1 Admission into M.Sc. **Physics** program of GITAM University is governed by GITAM University admission regulations.

2. ELIGIBILITY CRITERIA

- 2.1. A pass in B.Sc. degree with a minimum aggregate of 50% marks / a pass in any degree with minimum aggregate of 50% marks along with Mathematics, Physics and Chemistry/Electronics/Computer science or any related subject of equivalence as one of the subject.
- 2.2. Admission into M.Sc. **Physics** (Master of Science in **Physics**) will be based on an All India GITAM Science Admission Test (GSAT) conducted by GITAM University and the rule of reservation, wherever applicable.

3. CHOICE BASED CREDIT SYSTEM

Choice Based Credit System (CBCS) is introduced with effect from the admitted Batch of 2015-16 based on UGC guidelines in order to promote:

- Student Centered Learning
- Cafeteria approach
- Inter-disciplinary learning

Learning goals/ objectives and outcomes are specified leading to what a student should be able to do at the end of the program.

4. STRUCTURE OF THE PROGRAM

4.1 The Program Consists of

- i) Foundation Courses (compulsory) which give general exposure to a Student in communication and subject related area.
- ii) Core Courses (compulsory).
- iii) Discipline centric electives which
 - a) are supportive to the discipline
 - b) give expanded scope of the subject
 - c) give their disciplinary exposure
 - d) nurture the student skills
- iv) Open electives are of general nature either related or unrelated to the discipline.
- v) Practical Proficiency Courses, Laboratory and Project work.

4.2 Each course is assigned a certain number of credits depending upon the number of contact hours (lectures/tutorials/practical) per week.

4.3 In general, credits are assigned to the courses based on the following contact hours per week per semester.

- One credit for each Lecture / Tutorial hour per week.
- One credit for two hours of Practical per week.
- Eight credits for project.

4.4 The curriculum of the Four semesters M.Sc. **Physics** program is designed to have a total of 93 credits for the award of M.Sc. **Physics** degree.

5. MEDIUM OF INSTRUCTION

The medium of instruction (including examinations and project reports) shall be in English.

6. REGISTRATION

Every student has to register himself / herself for each semester individually at the time specified by the Institute / University.

7. ATTENDANCE REQUIREMENTS

- 7.1. A student whose attendance is less than 75% in all the courses put together in any semester will not be permitted to attend that end - semester examination and he/she will not be allowed to register for subsequent semester of study. He/she has to repeat the semester along with his / her juniors
- 7.2. However, the Vice Chancellor on the recommendation of the Principal / Director of the Institute/School may condone the shortage of attendance to the students whose attendance is between 66% and 74% on genuine grounds and on payment of prescribed fee.

8. EVALUATION

- 8.1. The assessment of the student's performance in a Theory course shall be based on two components: Continuous Evaluation (40 marks) and Semester-end examination (60 marks).
- 8.2. A student has to secure an aggregate of 40% in the course in continuous and semester end examinations the two components put together to be declared to have passed the course, subject to the condition that the candidate must have secured a minimum of 24 marks (i.e. 40%) in the theory component at the semester-end examination.
- 8.3. Practical / Viva voce etc. course are completely assessed under Continuous Evaluation for a maximum of 100 marks and a student has to obtain a minimum of 40% to secure Pass Grade. Details of Assessment Procedure are furnished below in Table 1.

Table 1: Assessment Procedure

S. No.	Component of assessment	Marks allotted	Type of Assessment	Scheme of Examination
1	Theory	40	Continuous evaluation	(i) Three mid semester examinations shall be conducted for 15 marks each. The performance in best two shall be taken into consideration. (ii) 5 marks are allocated for quiz. (iii) 5 marks are allocated for assignments.
		60	Semester-end examination	The semester-end examination shall be for a maximum of 60 marks.
	Total	100		
2	Practical's	100	Continuous evaluation	60 marks for performance, regularity, record/ and case study. Weightage for each component shall be announced at the beginning of the semester. 40 marks (30 marks for experiment(s) and 10 marks for practical Viva-voce.) for the test conducted at the end of the Semester conducted by the concerned lab Teacher.
	Total	100		
3	Project work	200	Project evaluation	150 marks for evaluation of the project work dissertation submitted by the candidate. 50 marks are allocated for the project Viva-Voce. The project work evaluation and the Viva-Voce shall be conducted by one external examiner outside the University and the internal examiner appointed by the Head of the Department.

9. SUPPLEMENTARY EXAMINATIONS & SPECIAL EXAMINATIONS:

- 9.1 The odd semester supplementary examinations will be conducted on daily basis after conducting regular even semester examinations in April/May.
- 9.2 The even semester supplementary examinations will be conducted on daily basis after conducting regular odd semester examinations during November/December
- 9.3 A student who has completed his/her period of study and still has "F" grade in final semester courses is eligible to appear for Special Examination normally held during summer vacation.

10. PROMOTION TO THE NEXT YEAR OF STUDY

- 10.1 A student shall be promoted to the next academic year only if he/she completes the academic requirements of 60% of the credits till the previous academic year.
- 10.2 Whenever there is a change in syllabus or curriculum he/she has to continue the course with new regulations after detention as per the equivalency established by the BoS to continue his/her further studies

11. BETTERMENT OF GRADES

- 11.1 A student who has secured only a pass or second class and desires to improve his/her class can appear for betterment examinations only in 'n' (where 'n' is no. of semesters of the program) theory courses of any semester of his/her choice, conducted in summer vacation along with the Special Examinations.
- 11.2 Betterment of Grades is permitted 'only once', immediately after completion of the program of study.

12. REPEAT CONTINUOUS EVALUATION:

- 12.1 A student who has secured 'F' grade in a theory course shall have to reappear at the subsequent examination held in that course. A student who has secured 'F' grade can improve continuous evaluation marks upto a maximum of 50% by attending special instruction classes held during summer.
- 12.2 A student who has secured 'F' grade in a practical course shall have to attend Special Instruction classes held during summer.
- 12.3 A student who has secured 'F' grade in a combined (theory and practical) course shall have to reappear for theory component at the subsequent examination held in that course. A student who has secured 'F' grade can improve continuous evaluation marks upto a maximum of 50% by attending special instruction classes held during summer.
- 12.4 The RCE will be conducted during summer vacation for both odd and even semester students. Student can register a maximum of 4 courses. Biometric attendance of these RCE classes has to be maintained. The maximum marks in RCE be limited to 50% of Continuous Evaluation marks. The RCE marks are considered for the examination held after RCE except for final semester students.
- 12.5 RCE for the students who completed course work can be conducted during the academic semester. The student can register a maximum of 4 courses at a time in slot of 4 weeks. Additional 4 courses can be registered in the next slot.

12.6 A student is allowed to Special Instruction Classes (RCE) ‘only once’ per course.

13. GRADING SYSTEM

13.1 Based on the student performance during a given semester, a final letter grade will be awarded at the end of the semester in each course. The letter grades and the corresponding grade points are as given in Table 2.

Table 2: Grades & Grade Points

Sl.No.	Grade	Grade Points	Absolute Marks
1	O (outstanding)	10	90 and above
2	A+ (Excellent)	9	80 to 89
3	A (Very Good)	8	70 to 79
4	B+ (Good)	7	60 to 69
5	B (Above Average)	6	50 to 59
6	C (Average)	5	45 to 49
7	P (Pass)	4	40 to 44
8	F (Fail)	0	Less than 40
9	Ab. (Absent)	0	-

13.2 A student who earns a minimum of 4 grade points (P grade) in a course is declared to have successfully completed the course, subject to securing an average GPA (average of all GPAs in all the semesters) of 5 at the end of the Program to declare pass in the program.

Candidates who could not secure an average GPA of 5 at the end of the program shall be permitted to reappear for a course(s) of their choice to secure the same.

14. GRADE POINT AVERAGE

14.1 A Grade Point Average (GPA) for the semester will be calculated according to the formula:

$$\text{GPA} = \frac{\Sigma [C*G]}{\Sigma C}$$

Where

C = number of credits for the course,

G = grade points obtained by the student in the course.

14.2 To arrive at Cumulative Grade Point Average (CGPA), a similar formula is used considering the student’s performance in all the courses taken, in all the semesters up to the particular point of time.

14.3 CGPA required for classification of class after the successful completion of the program is shown in Table 3.

Table 3: CGPA required for award of Class

Class	CGPA Required
First Class with Distinction	$\geq 8.0^*$
First Class	≥ 6.5
Second Class	≥ 5.5
Pass Class	≥ 5.0

* In addition to the required CGPA of 8.0 or more the student must have necessarily passed all the courses of every semester in first attempt.

15. ELIGIBILITY FOR AWARD OF THE M.Sc. Physics DEGREE

15.1 Duration of the program: A student is ordinarily expected to complete M.Sc **Physics** .program in four semesters of two years. However a student may complete the program in not more than four years including study period.

15.2 However the above regulation may be relaxed by the Vice Chancellor in individual cases for cogent and sufficient reasons.

15.3 A student shall be eligible for award of the **M.Sc Physics** Degree if he / she fulfills all the following conditions.

- a) Registered and successfully completed all the courses and projects.
- b) Successfully acquired the minimum required credits as specified in the curriculum corresponding to the branch of his/her study within the stipulated time.
- c) Has no dues to the Institute, hostels, Libraries, NCC / NSS etc, and
- d) No disciplinary action is pending against him / her.

15.4 The degree shall be awarded after approval by the Academic Council.

16. DISCRETIONARY POWER:

Not with standing anything contained in the above sections, the Vice Chancellor may review all exceptional cases, and give his decision, which will be final and binding

Program Educational Objectives

- 1 Students pursuing program will be pioneered in their chosen area
2. Inculcate profession with social responsibility and contribute to academic community with ethics
3. Ability to develop interdisciplinary research work
4. Work in the infrastructure development projects
5. Pursue higher studies and secure academic excellence in competitive exams

Program Objectives

- PO-1 The student acquires competence in evolution of physics, understanding concepts, analysing scientific theories and contribute to academic community, industry, consultancy and education with effective communication and ethical responsibilities
- PO-2 Gain substantial knowledge in various emerging areas of physics like Quantum mechanics, statistical mechanics, condensed matter physics, Nanoscience, Photonics and Electronics.
- PO-3 Use of mathematical tools in solving physical problems and have the solid background and experience required to model, analyze, and solve advanced problems in physics.
- PO-4 To apply advanced theoretical and/or experimental methods, including the use of numerical methods and simulations.
- PO-5 Will be able to apply fundamental principles of physics together with analytic tools to evaluate and describe complex physical situations.
- PO-6 Prepare students to evaluate the soundness of concepts proposed
- PO-7 Will empower the student to acquire scientific and practical knowledge by performing experiments in physics and electronics.
- PO-8 to develop abilities and skills that encourage research and development activities and are useful for society
- PO-9 to develop abilities and skills that encourage research and development activities and are useful in everyday life
- PO-10 To get job opportunities in higher education of core research, interdisciplinary research and in research organizations as scientific assistant, project assistant and many others.
- PO-11 To compete in national level tests like UGC-CSIR NET, JEST, GATE, etc., successfully.
- PO-12 Enhance their skills for continuous professional development in response to technological and social challenges

Program Specific Objectives

1. Ability to develop analytic and critical thinking with gained knowledge in major branches of physics.
2. Concern with intellectual curiosity and able to learn not only areas that are relevant to Physics and related programs
3. To enable the students for pursuing higher studies and careers in Physics
4. Apply the knowledge gained and perform basic research and collaborative research.
5. Improve scientific writing skills with latest methods
6. Cultivate competency at national and international level
7. Cultivate habit of lifelong learning and socially responsible citizens
8. Maintain Ethics and values with pedagogy

M.Sc. PHYSICS I - SEMESTER

SPH 701 CLASSICAL MECHANICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: The subject deals with two main formalisms – Lagrangian and Hamiltonian, to explain the mechanics of an object under the action of forces and constraints. A separate unit on rigid body dynamics and canonical transformation are included to demonstrate the ease of understanding of mechanics of a complicated system. A particular unit on small oscillation is included, which is essential in the understanding of many quantum mechanics concepts also.

Objective: To understand new formalism and their transformations for physical systems

Unit-I

The Lagrangian Formalism

Constraints, Generalized coordinates, principle of virtual work, D-Alembert's Principle, Lagrangian equation from D-Alembert's principle, Lagrange's equation and its applications, Velocity dependant potential in Lagrangian formulation, Lagrange's equation in non conservative systems. Generalized potential, Lagrange's equation in EM field, Hamilton's principle and Lagrange's equation.

Unit-II

Hamiltonian's Formalism

Generalized momentum and Cyclic Coordinates, conservation theorems- linear and angular momentum and energy. Hamilton's equations, Applications of Hamiltonian dynamics- Harmonic oscillator, particle in central field, Electromagnetic field and compound pendulum. Calculus of variation and Euler-Lagrange's equation, Deduction of Hamilton's principle from D-Alembert's principle. Deduction of Lagrange's equation from variation principle and principle of least action.

Unit-III

Rigid body Dynamics

Independent coordinates of rigid body, The Euler angles, infinitesimal rotations as vectors, components of angular velocity, angular momentum and inertia tensor, principal moments of inertia, Rotational kinetic energy of rigid body. Euler's equation of motion for rigid body, torque free motion of rigid body and force free motion of a symmetrical top.

Unit-IV

Canonical Transformation

Canonical transformations, Legendre transformation, generating functions, Equations of canonical transformation, conditions and applications of canonical transformations and infinitesimal canonical transformations Poisson brackets Lagrange's bracket and relation and invariance of Poisson bracket with canonical transformation and Liouville's theorem.

Unit-V

Small Oscillations

Introduction, potential energy and equilibrium-one dimensional oscillator-stable, unstable and neutral equilibrium. Two coupled oscillators-solution in differential equation, normal coordinates and normal modes. Theory of small oscillations-secular equation and eigen value equation, solution of eigen value equation and small oscillations in normal coordinates.

Text Books:

1. Classical Mechanics by H. Goldstein, Narosa Publishing House 2nd Edition 1980
2. Introduction to Classical Mechanics by Takwale Puranik, TMH, 1979
3. Classical Mechanics by J.C.Upadhaya, Himalaya Publisher, 2005

Course Outcomes:

- The student will Learn the concept of generalized coordinates and deduce Lagrange's equation, apply it to many systems to understand the efficiency of the Lagrange's formalism
- Learn about cyclic coordinates and related conservation theorems based on Hamilton's formalism.
- Will gain an understanding of the principle of least action. Learns to determine the Euler angles to describe the motion of a rigid body and study the Euler's equation of motion for rigid bodies
- Understand the concepts of Canonical transformation to obtain the generalized cyclic coordinates. The student will learn the techniques of Poisson's brackets and Liouville's theorem
- The student will be able to formulate the models of Oscillators to describe various physical systems.

**M.Sc. PHYSICS I – SEMESTER
SPH 703 QUANTUM MECHANICS**

Hours per week: 4

Credits: 4

End Examination: 60 Marks

Sessionals: 40 Marks

Preamble: This course imparts knowledge on the advanced level of quantum mechanics

Objective: To develop familiarity with advanced mathematical formalisms in understanding and interpreting systems in microscopic dimension.

Unit-I**General Formalism of Wave Mechanics**

Linear vector space, Postulates of wave mechanics, Operators and their properties, Hermitian operators, Eigen values and eigen functions, Commutator algebra, Bra-Ket vectors and their properties, Dirac-delta function and Korncker- delta function, Matrix representation, Change of basis, uncertainty relation, momentum representation.

Unit-II**Schrodinger's Wave Equation and its Applications**

Times dependent and time independent Schrodinger's wave equation, Admissibility conditions of the wave function, Stationary state solution, continuity equation, Ehrenfest's theorem, particle in a potential well, a box, step potential ($E > V$ and $E < V$), Rectangular potential barrier ($E > V$ and $E < V$), Square well potential ($E > V$ and $0 < E < V$) and harmonic oscillator.

Unit-III**Spherically Symmetric Potentials**

Particle moving in spherically symmetric potential, system of two interacting particles, rigid rotator, free particle, three dimensional square well, three dimensional harmonic oscillator, hydrogen atom, hydrogen orbits, three dimensional square well potential and the deuteron.

Unit-IV

Angular Momentum

Angular momentum operators, Commutation relations, Eigen values and Eigen functions of angular momentum operators, general angular momentum, spin angular momentum, Pauli' spin operators and their properties, Addition of angular momenta: Clebsch- Gordon coefficients and its properties.

Unit-V

Perturbation Theory

Time independent perturbation theory: (1) Non-degenerate system- first order and second order corrections to energy and wave functions, first order corrections to anharmonic oscillator and He atom (2) degenerate systems-first order correction to wave function and energy, first order Stark effects, spin orbit interaction, Variation method: ground state and first excited state of the Helium atom.

Text Books:

1. A text book of Quantum Mechanics by P. Mathews and K.Venkatesan, TMH,1979
2. Quantum Mechanics by E.Merzbacher, Wiley Publishers, 3rd Edition,1997
3. Quantum Mechanics by Leonard Schiff TMH 3 Edition,1968nd
4. Modern Quantum Mechanics by J.J.Sakurai, Pearson Edu.,2nd edition,2010
5. Quantum Mechanics by G. Aruldhas, PHI, 2nd Edition,2009

Course Outcomes:

1. Quantum mechanical postulates and various types of representation of eigen states ,Operator formalism and calculation of specific values of the operators
- 2.the time-dependent and time-independent Schrödinger equation for simple potentials like for instance the harmonic oscillator and hydrogen like atoms, as well as the interaction of an electron with the electromagnetic field
- 3.Application of specific problems to three dimensional systems
- 4.Understand operator formalism, angular momentum states, general angular momentum, angular momentum addition rules.
- 5.approximate methods for solving the Schrödinger equation using perturbation theory and the variational method.

M.Sc. PHYSICS I-SEMESTER SPH 705 ELECTROMAGNETIC THEORY

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: Course deals with static, moving charges and their associated phenomena

Objective: To attribute the principles of Electricity and Magnetism with its application to images, boundaries and propagation through media.

Unit-I

Electrostatics

Electric field, Coulomb's law, Continuous charge distribution, Divergence of E, curl of E, Applications of Gauss's law, Electric Potential-Poisson's and Laplace equation, Potential of localized charge distribution, Work done to move a charge, Energy of point and continuous charge distribution, Induced charges, surface charge and the force on a conductor, Dielectrics, Electric displacement, Gauss's law in dielectrics, polarization.

Unit-II

Boundary Value Problems (12Hrs)

Laplace's equation in 1D, 2D and 3D, Boundary conditions, Classic image problem, induced surface charge, Force and Energy, Boundary value problems and their solutions by separation of variables. Multipole expansion. Electric dipole and quadrupole moments.

Unit-III

Magnetostatics(12Hrs)

Lorentz force law, Magnetic fields, Magnetic forces, currents, Biot -Savarts law-Steady currents, magnetic field of steady current, Divergence and curl of B –Straight line currents, Applications of amperes law, Magnetic vector potential.

Magnetization-Diamagnets, para, ferromagnets, torques and forces in magnetic dipoles Field of magnetized object-bound currents and physical interpretation, Amperes law in magnetized materials.

Unit-IV Electrodynamics

(12Hrs)

Electromotive force-ohm's law, Motional EMF, Faraday laws, Induced electric field, Inductance, Energy in magnetic fields. Maxwell equations-magnetic charge, Maxwell equations in matter, Charge and Energy equation, pointing theorem.

Unit-V

Electromagnetic waves (12Hrs)

Waves in one dimension-wave equation, sinusoidal waves, Boundary conditions, reflection, transmission, polarization, Electromagnetic wave equation for E and B, Monochromatic plane waves, energy and momentum in EM waves. The Potential formulation-scalar and vector potential, gauge transformations, coulomb and Lorentz gauge transformations

Text Books:

1. Introduction to Electrodynamics by Griffiths, PHI, 3rd Edition , 1999
2. Classical Electrodynamics by J.D. Jackson, John Wiley, 3rd Edition, 1998
3. Foundations of Electromagnetic Theory by John R. Reitz, Frederick J. Milford, Robert W. Christy, Wiley, 4th Edition 2008

Course Outcomes:

- The student will learn to specify the constitutive relationships for electric fields based on Coulomb's law, Gauss's theorem and understand why they are required.

- Will understand the importance of dielectrics in the major role played by them in electronic devices. He/she learns the importance of boundary value problems, and the application of boundary conditions to solve different field problems.
- Understands the Laplace's equation and different multipoles. Calculates the magnetic fields due to different types of currents
- Understand the basic mechanism of magnetism and differences between dia, para, ferro magnets. Learns about pointing theorem and the electromagnetic energy transfer in medium.
- Knowledge of, physical interpretation, and ability to apply Maxwell's equations to determine fields. Formulate and analyze problems (solving for potentials, fields) involving media with different boundaries. Learns about EM waves and their nature, propagation etc.

M.Sc. PHYSICS I - SEMESTER

SPH 707 MATHEMATICAL METHODS OF PHYSICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: To quantify physical systems using mathematical methods

Objective: To analyze the role of few Mathematical Methods for the interpretation of Physical systems.

Unit-I

Complex analysis

Analytic function, CR equations, Elementary functions of complex variable, Harmonic functions, Cauchy Integral theorem, Evaluation of integrals. Cauchy's residue theorem and Evaluation of residues and evaluation of Contour integration.

Unit-II

Special functions

Legendre, Hermite, Laguerre and Bessel differential equations and solution, Recursion formula, Generating function, Recurrence relations and orthogonal properties.

Unit III

Fourier series

Determination of Fourier coefficients- Fourier series even and odd functions, Fourier series in arbitrary interval, half range Fourier sine and cosine expansions.

Unit-IV

Laplace Transforms

Introduction, Laplace transform, Laplace transform of some standard functions, properties of Laplace transform, Evaluation of integral using Laplace transform, Laplace transform of periodic functions, Inverse Laplace transforms, application of Laplace transform to differential equations with constant coefficients and applications to simultaneous differential equations.

Unit-V

Matrices

Introduction, Matrix, Definitions associated with matrices, adjoint of square matrix, reciprocal of matrix, Elementary transformations, rank of matrix, Non homogenous and homogenous

linear equations, Linear dependence and independence of vectors, Eigen values and Eigen vectors, Caley-Hamilton theorem, minimal polynomial and equation of matrix, Function of square matrix and similarity of matrices.

Text Books:

1. Mathematical Physics by B.D.Gupta, Vikas publishing House, 3rd Edition 2004
2. Mathematical Physics by R.V. Church Hill
3. Engineering Mathematics by E.Kreyszig, Wiley Publishers
4. Engineering Mathematics by Ravish R Singh, Mukul Bhatt, TMH

Course Outcomes:

- Realization and evaluation of analytic, poles and zeros of complex variables. Evaluation of residues and contours with relevant theorems. Understand the differential equations of special differential equations.
- Generating functions and recursion relations of special differential equations. Understanding Fourier series for evaluation of coefficients
- Application of Fourier series for physical problems. Understanding Laplace transforms and its application to periodic functions
- Understanding Inverse Laplace transform and its transformation from time and frequency domain. Gains knowledge of matrices with properties and determination of Eigen values and Eigen vectors
- Understand matrices and its representation in equation

**M.Sc. PHYSICS I – SEMESTER
SKILL ENHANCEMENT COURSE
SSE 701: BASIC COMPUTER CONCEPTS**

Hours per week: 3
Credits: 2

Continuous Evaluation: 100 Marks

Preamble: The course gives an understanding about the characteristics and classification of computers, various components of computer along with different operating systems that are available. It gives a hands on training on the packages MS-Word, MS-Power Point and MS-Excel. The course also comprehends AI tools.

Objective:

- To introduce components of digital computer and their working along with the outline of Operating Systems.
- To give hands on training on MS-Word, Power Point and Excel features.

Basics of Computers: Definition of a Computer - Characteristics and Applications of Computers – Block Diagram of a Digital Computer – Classification of Computers based on size and working – Central Processing Unit – I/O Devices, Primary, Auxiliary and Cache Memory – Memory Devices. Software, Hardware, Firmware and People ware – Definition and

Types of Operating System – Functions of an Operating System – MS-DOS –MS Windows, UNIX.

MS-Word

Features of MS-Word – MS-Word Window Components – Creating, Editing, ormatting and Printing of Documents – Headers and Footers – Insert/Draw Tables, Table Auto format – Page Borders and Shading – Inserting Symbols, Shapes, Word Art, Page Numbers, Equations – Spelling and Grammar – Thesaurus – Mail Merge.

MS-PowerPoint

Features of PowerPoint – Creating a Blank Presentation - Creating a Presentation using a Template - Inserting and Deleting Slides in a Presentation – Adding Clip Art/Pictures - Inserting Other Objects, Audio, Video- Resizing and Scaling of an Object –Slide Transition – Custom Animation.

MS-Excel

Overview of Excel features – Creating a new worksheet, Selecting cells, Entering and editing Text, Numbers, Formulae, Referencing cells – Inserting Rows/Columns –Changing column widths and row heights, auto format, changing font sizes, colors, shading.

Reference Books:

1. Fundamentals of Computers ,V.RajaRaman, PHI Learning Pvt. Ltd, 2010.
2. Microsoft Office 2010 Bible,John Walkenbach, Herb Tyson, Michael R. Groh andFaithe Wempen, Wiley Publications, 2010.

Course Outcomes:

- Able to understand fundamental hardware components that make up a computer's hardware and the role of each of these components
- Understand the difference between an operating system and an application program, and what each is used for in a computer.
- Acquire knowledge about AI tools.
- Create a document in Microsoft Word with formatting that complies with the APA guidelines.
- Write functions in Microsoft Excel to perform basic calculations and to convert number to text and text to number.
- Create a presentation in Microsoft PowerPoint that is interactive and legible content

**M.Sc. PHYSICS I – SEMESTER
SKILL ENHANCEMENT COURSE
SSE 703: INFORMATION TECHNOLOGY TOOLS**

Hours per week: 3
Credits: 2

Continuous Evaluation: 100 Marks

Preamble: The course enables the student to understand networking concepts related to Internet and introduce the social Networking sites and working of Email. It gives orientation of Block Chain technology. It give hands on training in SPSS, R Programming and creation of simple HTML documents.

Objective:

- To enable the student to understand networking concepts related to Internet and introduce the social Networking sites and working of Email.
- To give orientation of Block Chain technology.
- To give hands on training in SPSS, R Programming and creation of simple HTML documents

Introduction to Internet: Networking Concepts, Data Communication –Types of Networking, Internet and its Services, Internet Addressing –Internet Applications–Computer Viruses and its types –Browser –Types of Browsers.

Internet applications: Using Internet Explorer, Standard Internet Explorer Buttons, Entering a Web Site Address, Searching the Internet– Introduction to Social Networking: twitter, tumblr, LinkedIn, facebook, flickr, skype, yahoo!, google+, youtube, WhatsApp, etc.

E-mail : Definition of E-mail, Advantages and Disadvantages, User Ids, Passwords, Email Addresses, Domain Names, Mailers, Message Components, Message Composition, Mail Management, Email Inner Workings.

WWW-Web Applications, Web Terminologies, Web Browsers ,URL–Components of URL, Searching WWW –Search Engines and Examples.

Block Chain technology: What is Block Chain, Blockchain Architecture, How Block chain Transaction Works? Why do we need Blockchain? Block chain versions, Block chain Variants, Block chain Use Cases, Important Real-Life Use Cases of Block chain Bitcoin cryptocurrency: Most Popular Application of Block chain, Block chain vs. Shared Database, Myths about Block chain, Limitations of Block chain technology.

SPSS : SPSS Commands, Descriptive Statistics, Hypothesis Testing, Test of Difference, Analysis of Variance- One Way ANOVA, Non Parametric Tests, Correlation Analysis, Regression Analysis.

R Programming: Becoming familiar with R, Working with Objects, Introduction to Graphical Analysis.

HTML: WEB Terminology, Structure of HTML Document, HTML – Head and Body tags, Semantic tags- HR- Heading, Font, Image & Anchor tags, Different Types of Lists using Tags, Table Tags, Image Formats – Creation of Simple HTML Documents.

Reference Books:

- In-line/On-line : Fundamentals of the Internet and the World Wide Web by Raymond Greenlaw and Ellen Hepp, 2nd Edition, TMH.
- Microsoft Office 2010 Bible by John Walkenbach, Herb Tyson, Michael R. Groh and Faithe Wempen, WileyPublications.

Course Outcomes:

- Enable to understand the basic networking concepts, types of networks, Internet Explorer and www.
- Outline the Block chain architecture, Bitcoin Crypto currency and Limitations of Block Chain.
- Choose different statistical tests to be performed on the data sets.
- Demonstrate the R programming with simple graphs.

To make use of commands to structure HTML document

**M.Sc. PHYSICS I - SEMESTER
SPH 721 GENERAL PHYSICS LAB**

Hours per week: 6

Continuous Evaluation: 100 Marks

Credits: 3

Objective: To impart knowledge in fundamental concepts of light, constants of solids, velocity of waves through media and quantum behavior of light.

1. Specific Charge of Electron
2. Rydberg constant
3. Boltzmann Constant
4. Ultrasonic Interferometer
5. Franck Hertz Experiment- Existence of discrete states of atom
6. Thermo EMF

7. Determination of Planck's constant

8. Laws of photo electric effect

9. Hall Effect

Course Outcomes

1. The students will understand different types of bonds in materials
2. Identify the characteristics behavior of semiconductors and conductors
3. Determine the band gap, magneto resistance, resistivity and charge carrier concentration in semiconductors.
4. Comprehend the concepts through simple experiments.
5. Verify principles of quantum mechanics
6. Evaluate theoretical calculations using experimental observations.

M.Sc. PHYSICS I - SEMESTER SPH 723 C-PROGRAMMING LAB

Hours per week: 6

Continuous Evaluation: 100

Marks

Credits: 3

1. Arranging words in alphabetical order
2. Finding of largest and smallest from a set of numbers
3. Multiplication of two square matrices
4. Write functions for (i) reverse the string (ii) converting integer into string
5. Write functions for (i) string copy (ii) string compare (iii) Replace a sub-string with another string
6. Sorting series of elements.
7. Exchange elements of two arrays using pointers.
8. Number of sum of all integers greater than 100 and less than 200 that are divisible by a given integer x .
9. Reverse digits using *while* loop
10. Read n numbers into an array, and compute the mean, variance and standard deviation

M.Sc. PHYSICS I - SEMESTER VDC111: Venture Discovery

L T P C
2 0 0 2

Course Description:

India as part of its “Make in India” initiative has been focusing on creating incubation centers within educational institutions, with an aim to generate successful start-ups. These start-ups will become employment creators than employment seekers, which is the need of the hour for our country. This common course (university core) for all the disciplines is a foundation on venture development. It is an experiential course that starts with students discovering their deeper self in terms of how they might contribute to society by creating exciting new products and services that can become the basis of real businesses. The students learn about the emerging areas of knowledge that are the foundations of any successful company. They will learn how to develop insight into the problems and desires of different types of target customers, and from this, to identify the design drivers for a specific innovation. Students will learn specific design methods for new products and services. The students will learn that as important as the product or service itself, is a strategy for monetizing the innovation – for generating revenue, structuring the operating costs, and creating the operating profit needed to support the business, hire new employees, and expand forward. This course is aimed to be the beginning of what might be the most important journey of personal and career discovery so far in a student’s life, one with lasting impact. This is not just a course, but potentially, an important milestone in life that a student remembers warmly in the years to come.

Course Objectives

Students have the opportunity to:

1. Discover who they are – Values, Skills, and Contribution to Society
2. Understand how creativity works and permeates the innovation process
3. Learn the basic processes and frameworks for successful innovation.
4. Gain experience in actually going through the innovation process.
5. Conduct field research to test or validate innovation concepts with target customers.
6. Understand innovation outcomes: issues around business models, financing for start-ups, intellectual property, technology licensing, corporate ventures, and product line or service extensions.

Unit 1: PERSONAL DISCOVERY

No of Hours: 4

Personal Values, Excite & Excel, Build a Team, Define Purpose, Mission Statement

Learning Outcomes

After completion of this unit, the student will be able to

- Identify one's core values, personal strengths and weaknesses and how he/she can contribute to the society L4
- Build a team based on common values and varying abilities of teammates L6
- Define Vision and Mission statements for a prospective venture L6

Pedagogy tools:

Report , Lecture , Practical

Unit 2: IDEATION

No of Hours: 10

Ideation & Impact, User Insights - Frameworks, Customer Interviews, Interpreting Results

Learning Outcomes

After completion of this unit, the student will be able to

- Identify a problem/idea to work on by brainstorming with teammates L4

- Formulate a questionnaire and obtain insights into Customer thought process through Observation and Interviews L6
- Reshape the idea based on customer responses L5

Pedagogy tools:

Self-reading , Video , Report , Lecture , Case study

Unit 3: SOLUTION DISCOVERY

No of Hours: 8

Concept Design, Competitive Analysis, Product Line Strategy, Prototyping Solutions, Reality Check

Learning Outcomes

After completion of this unit, the student will be able to

- Prepare a Customer Value Proposition to explain the value of their product to the customer L6
- Compare their product with existing products through a competitive matrix L5
- Express a potential solution through Prototyping L6

Pedagogy tools:

Self-reading , Video , Report , Lecture , Practical , Case study

Unit 4: BUSINESS MODEL DISCOVERY

No of Hours : 4

Understand the Industry, Types of Business Model, Define Revenue Models, Define Operating Models, Define Customer Journey, Validate Business Model

Learning Outcomes

After completion of this unit, the student will be able to

- Identify the trends in their chosen industry L2
- Explore marketing and distribution channels for their product L2
- Calculate revenues and operating expenses for their product L3

Pedagogy tools:

Self-reading , Report , Lecture , Case study

Unit 5: DISCOVERY INTEGRATION

No of Hours : 4

Define Company Impact, Create Value, Tell Your Story

Learning Outcomes

After completion of this unit, the student will be able to

- Understand how to balance societal and economic impact of their venture L1
- Implement a framework for making profit L6
- Make a pitch to present their case for actually starting a company L6

Pedagogy tools:

Self-reading , Video , Report , Lecture

Textbook(s)

Meyer and Lee,'Personal Discovery through Entrepreneurship, The Institute for Enterprise Growth, LLC. Boston, MA., USA',1,The Institute for Enterprise Growth, LLC,Boston (MA), USA,2020,NIL,Prepared as per Syllabus

Additional Reading(s)

Adi Ignatius (Editor-in-Chief), 'Harvard Business Review', All, Harvard Business Publishing, Brighton, Massachusetts, 2021, <https://hbr.org/>, Based on the Case Study

Course Outcomes(COs)

On completion of the course, the student would be able to:

1. Identify ones values, strengths and weaknesses and their will to contribute to the society
2. Formulate an idea and validate it with customers
3. Demonstrate prototyping and analyze the competition for the product
4. Create business models for revenue generation and sustainability of their business
5. Come up with a pitch that can used as the basis for actually starting a company based on an impactful innovation and societal impact

M.Sc. PHYSICS II - SEMESTER
SPH 702 STATISTICAL MECHANICS

Hours per week: 4

End Examination: 60

Marks

Credits: 4

Sessionals: 40 Marks

Preamble: This course deals with the theory of ensembles and their applicability, classical and quantum statistics, Bose-Einstein condensation, free Fermi gas, theory of white dwarfs and physics behind the Chandrasekhar limit; theory of non-ideal gases, theory behind magnetism.

Objective: Conceptual understanding with Molecular basis for thermodynamics, to explore the connectivity of microscopic and macroscopic phenomena qualitatively.

Unit- I

Statistical Description of Systems of Particles and their Thermodynamics

Specification of the state of a system, Statistical ensemble, Phase space Basic postulates, Probability calculations, Behavior of the density of states, Thermal interaction, Mechanical interaction and General interaction. Dependence of the density of states on the external parameters, Statistical calculation of thermodynamic quantities

Unit- II

Interpretation of Ensembles

Isolated system, System in contact with a heat reservoir, simple application of the Canonical distribution and Grand canonical ensemble, Probability distribution functions, mean energies, Fluctuations in energy and density in a canonical ensemble and Grand Canonical ensemble, Connection with thermodynamics.

Unit- III

Applications of Statistical Mechanics

Partition functions and their properties, calculation of thermodynamic quantities, Gibbs paradox, Validity of the classical approximation, specific heats of solids-Dulong and Petits law, Einstein specific heat theory, Debye specific heat theory, Equipartition theorem, Applications as-harmonic oscillator.

Unit- IV

Quantum Statistics of Ideal Gases

Identical particles and symmetry requirements, Formulation of the statistical problems, The quantum distribution functions, Maxwell-Boltzman statistics, Photon statistics, Bose- Einstein statistics, Fermi Dirac statistics- Calculation of dispersions, Equation of state for Ideal Bose and fermi gas, Bose- Einstien condensation, Theory of white dwarf stars, Quantum statistics in

the classical limit.

Unit- V

System of Interacting Particles

Lattice vibrations and Normal modes, Non-ideal classical gas, Calculation of partition function- low densities, Equation of state, virial coefficients and its evaluation with integrals, Ferromagnetism- interaction between spins, Weiss molecular field approximation, high and low temperatures. Phase Transitions- Phase diagram, Thermodynamic description, 1st and 2nd order phase transitions, Clausius Clapeyron equation and Landau theory of phase transitions.

Text Books:

1. Fundamental Statistical and Thermal physics F.Reif ,Waveland Pr Inc, 4th Edition, 2008
2. Statistical Mechanics by K. Huang Wiely, 2nd Edition,1987

Course Outcomes:

- Learned how to approach a problem statistically. Gained knowledge on how accessible states determines the properties of systems. Learned about different interactions
- Gained knowledge on the intimate relationship between thermodynamics and statistical mechanics. Acquired basic idea on various ensembles
- How to explain physical phenomena using different ensembles
- Distribution laws of Fermi Dirac, Maxwell Boltzmann, and Bose Einstein statistics are understood Behavior of FDS, BES, and MBS at different temperatures are understood.
- Behavior of non-ideal gases are understood. Gained knowledge on how ferromagnetism, specific heats can be explained on the basis of statistical mechanics.

M.Sc. PHYSICS II - SEMESTER

SPH 704: ATOMIC AND MOLECULAR PHYSICS

Hours per week: 4

Credits: 4

End Examination: 60 Marks

Sessionals: 40 Marks

Preamble: This course introduces the basic ideas of atomic and molecular physics. It teaches students how to apply quantum mechanics and extract information from many-electrons atoms and molecules and research in atomic and molecular physics.

Objective: To introduce the origin of atomic structure, molecular structure with vibrational, rotational and electronic Spectra

Unit I

Vector Atom Model

Bohr-Sommerfeld model of atomic structure, atomic quantum numbers – hydrogen spectrum – fine structure of hydrogen atom, Larmor precession, Electron spin, Vector atom model, Spectroscopic terms and their notations, Stern and Gerlach Experiment, Spin - Orbit interaction and fine structure, Relativistic corrections for energy levels of hydrogen atom, Lamb shift.

Unit II

Many-electron atoms

Identical particles, Pauli's exclusion principle and electronic configuration, Spectrum of helium. Central field approximation and the periodic table, L-S and j-j coupling, Landau g factor – Equivalent and nonequivalent electrons, Spectrum of alkali and alkaline atoms.

Unit III

Hyperfine Structure of Spectral Lines

Normal and anomalous Zeeman Effect, Paschen-Bach & Stark effect, Isotope Effects, Nuclear Spin and Hyperfine Splitting, Intensity Ratio and Determination of Nuclear Spin, Zeeman Effect in Hyperfine Structure, Origin of X-ray Spectra and Electron Paramagnetic Resonance.

Unit IV Molecular

Physics

Types of Molecular spectra, Born-Oppenheimer approximation, rotational spectra of diatomic molecule as a rigid rotator, Energy levels and Spectra of a non-rigid diatomic molecule, Effect of isotopic substitution on rotational spectra, Vibrational-Rotational spectra, vibrating diatomic molecule as a harmonic oscillator and as anharmonic oscillator. Electronic Spectra, Frank Condon principle.

Unit V

Raman and NMR Spectroscopy

Raman Spectroscopy-Raman scattering classical and quantum theories, Vibrational and rotational Raman spectra, Selection rules, Infrared spectroscopy –basic concept of IR spectroscopy –IR spectrometer –Principle and Instrumentation. NMR spectra-principle, spectrometer, Chemical shifts and applications.

Text Books:

1. Principles of Modern Physics by A.K.Saxena, 2nd Edition, Narosa Publishing, 2010
2. Fundamentals of Molecular Spectroscopy by C.N.Banwell and E.M Cash, TMH 4th Edition, 1994
3. Atomic and Molecular Spectra - Rajkumar
4. Introduction to Atomic Spectra H. E. White

Course Outcomes:

1. Understanding the atomic structure through atomic models. Understanding the fine structure in Hydrogen atom by using spin – orbit interaction. Introducing Pauli's exclusion principle and electronic configuration.
2. Extract spectroscopic information from single and many electron atoms. Understanding the fine structure of the atoms in the presents of magnetic and electric fields.
3. Understanding the origin of X-ray and principle of EPR
4. Understanding the types of molecular spectra. Understanding electronic transitions in different molecules using Frank-Condon principle. Understanding the principle of Raman and IR spectroscopy.
5. Understanding the NMR spectroscopic technique for analyzing various material properties.

M.Sc. PHYSICS II - SEMESTER
SPH 706: ADVANCED QUANTUM MECHANICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: This course imparts knowledge on the advanced level of quantum mechanics

Objective: To develop knowledge in foundations of quantum mechanics and its applications to advanced phenomena/systems/problems.

Unit I

Approximate Methods

WKB Approximation, connecting formulas, its validity, Barrier penetration, Alpha emission and bound states in Potential well and Bohr Sommerfeld quantum condition, Perturbation theory for time evolution problems- harmonic perturbation, transition of continuum states.

Unit II

Scattering

Scattering differential cross section, the scattering of wave packet, Born approximation and its applications, Partial wave analysis method, Expansion of a plane wave in terms of partial waves, determination of the phase shifts and scattering amplitude, optical theorem and applications.

Unit III

Identical particles and Many Electron Atoms

Indistinguishable particles, interchange symmetries, exchange degeneracy, Pauli's exclusion principle, spin of two and three electrons, spectra of Helium atom, ortho and para helium, Many Electron atoms- Central field approximation, Thomas Fermi model of atom, Hartree equation and Hartree Fock Equation (statement only).

Unit IV

Relativistic Wave Equations

Introduction-Generalization of Schrödinger equation, Klein Gordan Equation- its interpretation, Plane wave solutions, Charge and current densities, Interaction with electromagnetic field and Non relativistic limit, Dirac Equation- Relativistic Hamiltonian, Position probability density, Dirac matrices, Plane wave solutions, Spin of Dirac particle, Negative energy states, Magnetic Moment of electron, Spin orbit interaction.

Unit V

Quantization of Fields

Introduction, Classical approach to field theory, Relativistic Lagrangian and Hamiltonian of charged particle in electromagnetic field, Lagrangian and Hamiltonian formulations Quantum equation, second quantization, Quantization of non-relativistic Schrodinger equation, Klein Gordan equation.

Text Books:

1. A text book of Quantum Mechanics- P.Mathews and K.Venkatesan
2. Quantum Mechanics G.Aruldas

3. Quantum Mechanics-V.K.Thankappan
4. Fundamentals of Quantum Mechanics R.D.RatnaRaju

Course Outcomes

- The approximation methods will be understood and attributed to various problems
- Concepts of Scattering differential cross section, the scattering of wave packet are realized with phase shifts and scattering amplitude
- Indistinguishable particles, symmetries, Pauli's exclusion principle are realized and extended to many electron systems
- Schrodinger wave equation is understood under relativistic conditions and Concept of negative energy is understood.
- Lagrangian and Hamiltonian formulations are understood

M.Sc. PHYSICS II – SEMESTER **SPH 708 ELECTRONIC DEVICES AND CIRCUITS**

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: Electronics is a primary subject to gain knowledge about the basic semiconducting materials and the art of making devices – from diode, transistors, amplifiers, oscillators to memory devices. The course is designed to motivate students to develop an understanding of essential devices in detail, which are building blocks for the modern day electronic devices.

Objective: To analyze electronic devices for its characteristics, amplification and frequency response. Implementation of logic circuits with Boolean expressions and its application to counters with sequential logic gates.

Unit-I

BJT and FET amplifiers

Bipolar Junction Transistor: configurations, Biasing, BJT as an amplifier, BJT characteristics, Frequency response of BJT, Applications of Transistor. Field Effect Transistor: Construction and characteristics, Biasing, FET as an amplifier, and Applications of FET. MOSFET: Introduction, Depletion and Enhancement type MOSFETs. Feedback concepts: Practical feedback circuits, Feedback amplifiers, Oscillator operation, types of oscillators

Unit-II

Operational Amplifiers

Op-amp basics, parameters, Differential and common mode operation, virtual ground, practical op-amp circuits – Integrator, Differentiator and Summing amplifier. Op-amp Applications- Constant gain multiplier, Voltage to Current Converter, Current to Voltage Converter, Instrumentation Amplifier, Oscillators, Logarithmic and Anti Logarithmic Amplifiers, Schmitt trigger, Comparators.

Unit-III

Linear ICs and Opto Electronic Devices

Linear Ics: About IC 555 (Timer) and its applications: Astable, Monostable and Bistable multivibrators. VCO (IC 566), PLL (IC 565). Opto Electronic Devices Structure and operation, characteristics, spectral response and applications of LDR, Photo Voltaic cell, Photo diode, Photo transistor, LED and LCD.

Unit-IV

Combinational Logic Circuits : Simplification of Boolean expressions: Algebraic method, Karnaugh map method, EX-OR, EX-NOR gates, Encoders and Decoders, Multiplexers and Demultiplexers. Digital arithmetic operations and circuits: Binary addition, subtraction, multiplication and division. Design of adders, subtractors and Parallel binary adder. Applications of Boolean Algebra: Magnitude comparator, Parity generator and checker, Code converters, Seven segment decoder /Driver display, ALU design.

Unit-V

Sequential Logic Circuits

Flip-Flops: NAND latch, NOR latch, R-S, J-K, T-flip-flops, D-Latch Counters: Asynchronous (ripple) counters, Counters with MOD number $< 2^n$, Down counter, Synchronous counters, Up-down counter, Ring counter, Johnson counter. Applications of counters Registers: Shift registers, PIPO, SISO, SIPO, PISO, State diagrams.

Text Books:

1. Electronic Devices and Circuit Theory
R. Boylestad and L. Nashelsky- 10th Edition – Pearson
2. Digital Systems Principles and Applications Ronald J Tocci- 10th Edition –Pearson
3. Digital Design Morris Mano- 4th Edition Pearson
4. Op-Amp Applications Ramakanth Gaykward – 4th Edition- PHI

Course Outcomes

- Understands about Bipolar Junction transistor (BJT), Field effect transistors (FET), their characteristics and applications as amplifiers, feedback circuits.
- Student understands the basics of OP-Amp and Op-amp applications.
- Gain knowledge of rectifiers, filters, and different voltage regulators.
- Understands the construction of IC555 timer and its application as multivibrators.
- Learn the binary number system, Boolean operations, binary Gates, different arithmetic devices like Adders, subtractors, encoders, decoders, multiplexers, etc.
- Learns the Karnaugh map technique to simplify the Boolean expressions. and understands the concept of sequential logic circuits – Flip flops, counters, and registers.

M.Sc. PHYSICS II - SEMESTER

SPH 710 ELECTRONIC MEASUREMENTS AND INSTRUMENTATION (Common with M.Sc. Electronic Science)

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: This course was designed to introduce Instrumentation techniques

Objective: To explain basic concepts of measurement, importance of signal generators and analyzers.

Unit-I

Fundamental Measurements

Accuracy, Precision, Types of errors, Standards of measurements, Electronic Instruments: RMS, BJT and FET voltmeters, Electronic multimeter, Q meter, LCR meter, vector impedance meter, Power meter, Measurement of Inductance, Capacitance and Effective resistance at high frequency, CRO- study of various stages in brief, measurement of voltage, current, phase and

frequency, Digital and storage oscilloscopes.

Unit-II

Instruments for Generation and Analysis of waveforms

Signal generators, function generator, wave analyzers- Harmonic distortion analyzer, spectrum analyzer and spectrum analysis. Recording Instruments: X-Y, Strip chart, Magnetic tape and Digital type recorders, Transducers: Classification of transducers, Strain gauge, LVDT Thermocouple, Piezo-electric and photoelectric transducers, Flow measurement transducer.

Unit-III

Data Acquisition Systems

D/A conversion- Linear weighted and ladder type. A/D conversion- Digital ramp ADC, Successive approximation method, Data loggers, Signal Conditioning of the inputs, Computer based data systems, Electronic Indicating instruments: Seven Segment Display, Fourteen Segment Display, Nixie tube, LED and LCD display devices.

Unit-IV

Bio-Medical Instrumentation

Sources of Biomedical Signals, Basic Medical Instrumentation System, Origin of Bioelectric signals, Recording Electrodes- Electrode-tissue interface, Skin contact impedance, Biosensors, Measurement of Heart rate, Blood pressure measurement, blood flow meters. Bio-Medical Instruments: ECG, EEG, EMG, Electronic Pace maker.

Unit-V

Medical Imaging Systems

Radiography, X-Ray machine, CT scanner, Nuclear Medical Imaging systems: Physics of Radio Activity, Radiation Detectors, Gamma Camera, NMR imaging. Ultrasonic Imaging Systems, Ultrasonic Therapy Unit, Angiography and Fluoroscopy.

Text Books:

1. Electrical and Electronic Measurements and Instrumentation
Sawhney, Dhanpat Rai Publications, 3rd Edition , 2005
2. Hand Book of Biomedical Instrumentation- Khandpur by Tata McGraw Hill- 2nd Edition
3. Medical Instrumentation by Application & Design
– John G. Webster, Houghton Mifflin & Co., Boston
4. Biomedical Instrumentation by Marvin D. Wirs, Chilton Book Co., London

Course Outcomes:

- Deals with fundamentals of measurements in electronic circuits and operation of CRO
- To understand the Instruments for Generation and Analysis of waveforms and describe recording instruments.
- Will be able to understand data Acquisition Systems and know about LCD/LED Displays
- To understand bioelectric potentials and the construction of medical systems.
- Will be able to to understand medical imaging systems and know the operation of NMR

M.Sc. PHYSICS II – SEMESTER
SPH 712 ADVANCED ELECTROMAGNETIC THEORY

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: It is an advanced course on electrodynamics with focus on Maxwell's equations, radiating systems and accelerated radiating systems and electromagnetic waves in a medium.

Objective: To gain knowledge on electromagnetic wave transmission, radiating systems and its interaction with matter.

Unit- I

Electromagnetic Fields and Waves

Axiomatic classical electrodynamics, Complex notation and physical observables. Physical observables and averages Maxwell equations in Majorana representation, wave equations for E and B The time-independent wave equations for E and B, Electromagnetic Potentials and Gauges- scalar potential, vector potential, electrodynamics potentials, Gauge conditions- Lorenz-Lorentz gauge Coulomb gauge, velocity gauge and Gauge transformations

Unit –II

Fundamental Properties of the Electromagnetic Field

Discrete symmetries, Charge conjugation, spatial inversion and time reversal, C symmetry P symmetry, T symmetry, Continuous symmetries, General conservation laws- Conservation of electric charge, Conservation of energy. Conservation of linear (translational) momentum- Gauge-invariant operator formalism, Conservation of angular (rotational) momentum- Gauge-invariant operator formalism Electromagnetic duality and Electromagnetic virial theorem.

Unit- III

Radiation and Radiating Systems

Radiation of linear momentum and energy, Monochromatic signals Finite bandwidth signals and radiation of angular momentum. Radiation from a source at rest– electric multipole moments, Hertz potential, Electric dipole radiation, Magnetic dipole radiation. Radiation from an extended source volume at rest- Radiation from a one-dimensional current distribution.

Unit- IV

Accelerated Radiating Systems

Radiation from a localized charge in arbitrary motion –The Liénard-Wiechert potentials, Radiation from an accelerated point charge –The differential operator method, The direct method, Small velocities, Bremsstrahlung, Cyclotron and synchrotron radiation radiation in general case and virtual photons.

Unit- V

Electromagnetic Fields and Matter

Maxwell's macroscopic theory- Polarisation and electric displacement, Magnetisation and the magnetizing field, Macroscopic Maxwell equations. Phase velocity, group velocity and dispersions. Radiation from charges in a material medium –Vavilov-Cerenkov radiation Electromagnetic wave in conductive media, wave equations for E and B and plane waves.

Text Books:

1. Classical Electrodynamics J.D Jackson, 3rd Edition, Wiley, 1998.
2. Introduction to Electrodynamics D.Griffiths, PHI, 3rd Edition, 1999
3. Electromagnetic waves and Radiating systems K.Jordan and E Balmen Wiley, 2nd Ed.

Course Outcomes:

- Understanding Maxwell's equations and wave equations for E and B, Electrostatics potentials and different transformations will be understood.
- Understanding various symmetries, and understanding Conservation of energy, conservation of linear momentum and conservation of angular momentum in fields.
- Learnt about linear momentum and energy of radiation with radiations from electric dipole and magnetic dipole will be understood.
- Learnt about radiations from moving charges, Liénard-Wiechert potentials, Cyclotron and synchrotron radiation will be understood.
- Maxwell's macroscopic theory will be learned. Along with Radiation from charges in a material medium

M.Sc. PHYSICS II – SEMESTER SPH 714 PHYSICS OF SEMICONDUCTOR DEVICES

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: The course provides an introduction to the basic concepts in semiconductors, various transistors and photonic devices. It develops the design integrated circuit skills in electronic devices.

Objective: Understanding transport phenomena in solids, applications of semiconductor devices and microwave devices in design of amplifiers.

Unit- I

Transport phenomena in Solids

Energy bands: insulator, metal semiconductor, intrinsic and extrinsic semiconductor, direct and indirect semiconductor, Fermi level variation in semiconductor, temperature dependence of carrier concentration, carrier dynamics in semiconductors, carrier transport by drift and diffusion scattering low field response, high field transport, impact ionization, band to band tunneling charge injection and quasi Fermi levels.

Unit- II

Bipolar Transistors

BJT static performance parameters: Emitter injection efficiency, base transport factor, collector efficiency and current gain, Transient response: Cutoff saturation, the switching cycle, frequency limitations of transistors, secondary effects in real devices: Early effect and punch through thermal effects, current crowding effect, high injection and Kirk effect.

Unit- III

Field Effect Transistors

MOS device: MOS as capacitor, V-I characteristics, Depletion and Enhancement MOSFET, Complementary MOSFET, important issues in real devices: short channel effects, substrate bias, effects, latch-up, sub-threshold characteristics, leakage currents, charge transfer device, basic principle applications.

Unit- IV

Microwave and Photonic Devices

Tunnel diode, IMPATT and Gunn diode, varactor diode, characteristics of microwave transistor, tunnel transistor, LED, photo detectors, solar cells, semiconductor lasers

Unit -V

Integrated Circuits

Evolution of ICs: Small Scale Integration, Medium Scale Integration, Low Scale Integration, Very Large Scale Integration, Monolithic and Hybrid circuits, Monolithic IC process: Crystal growth, Wafer preparation, Metallization, Testing, Bonding and Packaging.

Text Books:

1. Solid state electronic devices ,Ben. G. Streetman and S. Banerjee, PHI, 6th Edition, 2005

2. Semiconductor devices - Basic principles, Jasprit Singh (John Wiley), 1st Edition, 2000

Course Outcomes

- Understanding the classifications of materials based band theory and transport phenomena in Solids.

- Understanding the working and performance of BJT and different effects in BJT.

- Understanding the working of FET and characteristics of FET.

- Understanding the working and performance of different diodes and different detectors.

- Understanding the different techniques for design ICs and design integrated circuit skills in electronic devices.

M.Sc. PHYSICS II - SEMESTER
SAE 702 PROFESSIONAL COMMUNICATION SKILLS

Hours per week: 3

Credits: 2

Continuous Evaluation: 100 Marks

Objective

To enable students to

- acquaint themselves with basic English grammar
- acquire presentation skills
- develop formal writing skills
- develop creative writing skills
- keep themselves abreast with employment-readiness skills

UNIT-I

Back To Basics

Tenses, Concord – Subject Verb Agreement, Correction of Sentences-Error Analysis, Vocabulary building

UNIT -II

Oral Presentation

What is a Presentation? Types of Presentations, Technical Presentation – Paper Presentation Effective Public Speaking, Video Conferencing,

UNIT- III

Documentation

Letter –Writing, E-mail Writing & Business Correspondence, Project Proposals, Report Writing, Memos, Agenda, Minutes, Circulars, Notices, Note Making

UNIT- IV

Creative Writing

Paragraph Writing, Essay writing, Dialogue Writing, Précis Writing, Expansion of Hints, Story Writing

UNIT V

Placement Orientation

Resume preparation, group discussion – leadership skills, analytical skills, interviews –Types of Interviews, Preparation for the Interview, Interview Process

Text Books :

1. Essentials of Business Communication by Rajendra Pal and J S KorlahaHi, Sultan Chand & Sons, New Delhi.
2. Advanced Communication Skills by V. Prasad, Atma Ram Publications, New Delhi.
3. Effective Communication by Ashraf Rizvi, McGraw Hill Education; 1 edition (27 June 2005)
4. Interviews and Group Discussions How to face them, T.S.Jain, Gupta, First Edition, New Delhi.
5. High School English Grammar and Composition, P.C.Wren & Martin, N.D.V.Prasada Rao (Editor), S.Chand, 1995.

**M.Sc. PHYSICS II - SEMESTER
SPH 722: SOLID STATE PHYSICS LAB**

Hours per week: 6

Continuous Evaluation: 100 Marks

Credits: 3

Objective: Skill sets for deterministic parameters of solids and liquids responsible for their physical properties

1. Forbidden energy Gap of LED/ Ge/ Si.
2. Forbidden energy Gap of semiconductor
3. Lattice dynamics- I Dispersive relations of mono atomic lattice
4. Lattice dynamics –II Dispersive relations of Di atomic lattice
5. Resistivity of semiconductor- Four Probe method
6. Dielectric constant
7. B-H Curve
8. Susceptibility of liquid – Quink’s Tube
9. Calibration of Electromagnet

Course outcomes

1. Demonstrate several key areas of solid State Physics as outlined in the Course
2. Apply their knowledge to solve problems in solid state physics.
3. Interpret experimental and computational results.
4. Demonstrate the orders of magnitude of the certain quantities and develop confidence
5. 5.Verification and illustrate behaviour

M.Sc. PHYSICS II - SEMESTER
SPH 724 ELECTRONIC DEVICES AND CIRCUITS LAB

Hours per week: 6

Continuous Evaluation: 100 Marks

Credits: 3

Objective: Application of various electronic devices in design of frequency and amplification. Implementation of logic gates for Boolean algebra with conversion from one system to another and its states for counting.

Any 10 Experiments

1. Active Band pass filter (IC 741)
2. Astable multivibrator (IC 555)
3. Wein bridge oscillator (IC 741)
4. Op-amp as Differentiator (IC 741)
5. Op-amp as Integrator (IC 741)
6. Twin T filter (IC 741)
7. Implementation of logic gates
8. Study of Adder and Subtractor (IC 7483)
9. Binary to Gray code converter (IC 7486)
10. BCD to Excess-3 code converter (7486)
11. Design of Flip-Flops with basic gates (IC 7486)
12. Multiplexer and Demultiplexer (IC 74151, 74154)
13. UP-Down counter (IC 74192,74193)

Learning Out comes

1. Understanding basics of basic semiconductor physics **Recall** previous knowledge, understand **how** the depletion layer forms and **explanation** capability on the working of different diodes characteristics (L1 and L2)
2. Understanding the basic construction of semi conductor devices like BJT and FET, **classification** of Devices and **compare** the VI characteristics of BJT and FET in different configurations (L2).
3. Understand the basic optical devices operation and **how** they work, and how to **make use of** photo electronic devices as sensors and **apply** the knowledge in real time applications (L1, L3).
4. Understand the **classification** of Rectifiers; identify the merits and demerits of different filters. **Apply** the basic rectifier, **Analyze** and compare the working of SMPS (L2 L4).

M.Sc. PHYSICS III - SEMESTER SPH 801 SOLID STATE PHYSICS

Hours per week: 4

End Examination: 60 Marks

Credits: 4

Sessionals: 40 Marks

Preamble: To understand various properties of solids and its phenomena.

Objective: Understanding the principles of solids from atomic point of view for its structure, thermal, electrical and magnetic properties.

Unit- I

Introduction to Crystals

Crystal structure, Unit cell, Symmetry operations-translation and point, crystal types, Indices of lattice direction and plane, interplanar spacing, density of atoms in crystal plane, Crystal structures- simplest, CsCl, NaCl, Alkali metals, Diamond and HCP. Reciprocal lattice, Bragg's law, laue interpretation of crystals, Imperfections in Crystal- Point, line, Burger vector, dislocation and Surface imperfections.

Unit- II

Lattice Vibrations

Introduction, Dynamics of chain of identical atoms, diatomic linear chain, Reststrahlen band, theory of harmonic approximation, Normal modes of real crystals, quantization of lattice vibration. Classical Lattice heat capacity, quantum theory of lattice heat capacity-average thermal energy of harmonic oscillator, Einstein and Debye model and Anharmonic effects- thermal expansion, phonon collision and thermal conductivity

Unit- III

Electronic theory of Solids

Free electron gas, electrical conductivity, Fermi surface and its effects on electrical conductivity, failure of free electron model, Energy bands in solids-Bloch theorem, periodicity of Bloch functions and eigen values, Kronig Penney model, nearly free electron model, zone schemes for energy bands, tight binding approximation, estimation of cohesive energy. Concept of holes effective mass, Fermi surfaces construction and de Haas-van Alphen effect.

Unit-IV

Dielectric Properties of materials

Polarisation, dielectric constant, local electric field, dielectric constant and its measurement, dielectric polarisability, sources of polarisability- theory of electronic, ionic and orientation. Dielectric losses, piezo, pyro and ferroelectric properties of crystals, ferroelectricity, ferroelectric domains, anti ferroelectricity and ferrielectricity.

Unit -V

Magnetic properties of Materials

Classification of magnetic materials, Atomic theory of magnetism-Hund's rules, origin of permanent magnetic moments, Langevin's theory of dia and paramagnetism. Quantum theory and formulation of magnetic susceptibility for dia and paramagnetism. Pauli paramagnetism, cooling by adiabatic demagnetization. Ferro magnetism- Weiss molecular field, ferromagnetic domains, domain theory, anti ferromagnetism and ferrimagnetism.

Text Books:

1. Solid State physics by M.A.Wahab Narosa Publishing House, 2005

2. Elements of Solid State physics by J.P. Srivastava PHI 2nd Edition
3. Elementary of Solid State physics by M.Ali Omar -Pearson Education, 1999

Course Outcomes:

- Understanding the classification of different crystals systems for specific properties. To understand the interpretation and imperfections of crystal systems. To analyze the crystals systems from concept of lattice
- To gain knowledge on theories of lattice and its phenomenological importance to crystal. To understand how to realize the electron theory of solids.
- To analyze approximations of crystals for solid. Introduction to dielectric and familiarize the various types of polarization
- Understand different classification of ferroelectric materials. To understand the magnetic properties with classical and quantum theories.
- Specific understanding for determination of susceptibility of various magnetic materials

**M.Sc. PHYSICS III - SEMESTER
SPH 803 NUCLEAR AND PARTICLE PHYSICS**

Hours per week: 4

End Examination: 60 Marks

Credits: 4

Sessionals: 40 Marks

Preamble: To attribute and realize particle phenomena of matter.

Objective: Acquaintance of basic laws of nuclear and particle physics to understand the nuclear stability and decay mechanisms.

Unit-I

General Properties, Nuclear Forces and Models

Introduction to nuclear properties, semi empirical mass formula, nuclear magnetic dipole moment, electric quadrupole moment. Deuteron bound state problem-excited states of the deuteron, Nucleon-nucleon scattering, Proton-proton and neutron-neutron interactions, Nuclear shell model: magic numbers, spin orbit interaction, prediction of angular momenta and parities for ground states.

Unit-II

Radioactivity and Nuclear Decay

The radioactive decay law, production and decay of radioactivity, natural radioactivity, α -decay process, Geiger Nuttal Law, Gamow's theory of α decay, Fermi's theory of β -decay, selection rules, parity violation in β -decay, properties of neutrino, energetics of gamma decay, selection rules, angular correlation, Internal conversion.

Unit-III

Nuclear Reactions

Introduction, kinds of nuclear reactions, conservation laws, nuclear reaction kinematics, charged particle reaction spectroscopy, neutron spectroscopy, nuclear cross section, compound nucleus, nuclear transmutations by α , protons, neutrons, deuterons, nuclear reactions with heavy ions, nuclear reaction cross section, different stages of nuclear reactions.

Unit IV

Nuclear Energy

Nuclear Fission, types of fission, distribution of fission products, neutron emission in Fission,

fissile and fertile materials, spontaneous fission, Bohr-Wheeler theory of nuclear fission, Nuclear Fusion, plasma fusion reactions, energy balance, Solar fusion, types of nuclear reactors.

Unit-V

Elementary Particle Physics

Introduction, Classification of elementary particles, Particle interactions and families, symmetries and conservation laws of energy and momentum, angular momentum, parity, Baryon number, Lepton number, isospin, strangeness quantum number, Gellmann and Nishijima formula, K-mesons and hyperons, Elementary ideas of CP and CPT invariance, Quark model and Grand Unified Theories.

Text Books:

1. Introductory Nuclear Physics-Kenneth S. Krane
2. Nuclear Physics D.C.Tayal, Himalaya publishing Co.,
3. Introduction to Nuclear Physics Harald A.Enge
4. Atomic Nucleus RD Evans
5. Introduction to Elementary Particles by D. Griffiths

Course Outcomes:

- The introduction to different properties of the nucleus. The student is able explain the origin of the various terms in the semi-empirical mass formula and in the nuclear shell model. Explain the different forms of radioactivity and account for their occurrence
- The student is able to explain alpha, beta and gamma decay at a basic particle physics level. Able to perform basic calculations of alpha, beta and gamma decay. The student is able to understand about the nuclear reactions and their classifications
- Performs basic kinematics of nuclear reactions with different incident particles. Able to explain the concepts of fission (spontaneous and induced), chain reactions and fusion, and perform the associated calculations demonstrating energy release. Learns to apply the concepts of fission and fusion to power generation and the sun as examples
- Learns the classification of elementary particles according to their quantum numbers and draw simple reaction diagrams (Feynman diagrams). Learns the concepts of Quark model and other unification theories.

M.Sc. PHYSICS III – SEMESTER
SPH 807 ANALOG AND DIGITAL COMMUNICATION

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: To introduce concept of modulation with Analog and Digital information signals.

Objective: Understanding communication between transmitter and receiver with baseband, band pass, coding techniques in communication systems.

Unit-I

Amplitude Modulation

Introduction, Amplitude Modulation, Amplitude Modulation index, MI for Sinusoidal Modulation Index, Frequency spectrum, Average Power for sinusoidal amplitude modulation. Effective voltage and current for Sinusoidal Amplitude Modulation. Amplitude Modulator circuits and Amplitude demodulator circuits and superhetrodyne receiver

Unit II

Single Side Band Modulation

Non sinusoidal modulation, double side band suppressed carrier modulation. Introduction to single side band, principles of SSB, balanced Modulators, SSB generation and SSB reception, modified SSB systems , signal to noise ratio for SSB systems and companded single side band.

Unit-III

Angle Modulation

Introduction, frequency modulation, Sinusoidal F.M, frequency spectrum of sinusoidal FM, Average Power of sinusoidal FM. Non Sinusoidal Modulation, Deviation ratio.

Measurement of modulation index for sinusoidal FM. Phase Modulation- equivalence between PM and FM. FM Transmission -Direct and Indirect methods.FM detectors- Slope detector, balanced double tuned detector and PLL detector

Unit-III

Pulse Modulation

Introduction to pulse modulation-Digital line wave forms: symbols, bits and bauds, functional notation for pulses, line codes and wave forms, unipolar -NRZ – RZ, Polar line codes. Pulse Modulation- Pulse amplitude modulation, Pulse code modulation, pulse frequency modulation pulse position modulation and pulse width modulation.

Unit-V

Digital Modulation And Transmission

Sampling Theorem, Signal reconstruction, Pulse Code Modulation (PCM) Quantization, Digital carrier systems-Amplitude shift keying,Phase shift keying and Frequency shift keying and Differential phase shift keying ,Differential PCM and Delta modulation.

Text Books:

1. Electronic Communications- Dennis Roddy and John Collins
2. Modern Digital and Analog Communication System - B.P.Lathi
3. Principles of Communication System – H.Taub and D.Schilling

Course Outcomes

- Understand the properties of signals and modulation for voltage and power.
- Helps to understand the Modulation and Demodulation of Amplitude modulation.
- Understand the drawbacks of AM and introduces hoe to understand SSB modulation
- Helps to understand generation and reception of SSB modulation
- Enable the student to un understand FM and PM modulation

- Understands the different methods for generation and detection of FM and PM.
- Helps in understanding the pulse modulation with its representation
- Understand the various pulse modulations with generation and detection.
- Acquire knowledge of Sampling theorem and reconstruction of digital signal
- Generation and detection of various digital modulation systems is understood.

M.Sc. PHYSICS III – SEMESTER

SPH 843 INTRODUCTION TO PHOTONICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: The course will outline the different concepts in photonics and will introduce the q-parameters of lens systems, properties of Gaussian beam profile, Nonlinear optics, materials, and photo detector and diodes.

Objective: Learning the principles of light propagation and its interactions with matter for photonic processes.

Unit I-Laser Cavity Modes

Line shape function and Full Width at half maximum (FWHM) for Natural broadening, Collision broadening, Doppler broadening, Longitudinal and Transverse modes. ABCD matrices and cavity Stability criteria for confocal resonators. Quality factor, Q-Switching, Mode Locking in lasers. Expression for Intensity for modes oscillating at random and modes locked in phase. Methods of Q-Switching and Mode locking.

Unit II-Gaussian Beam

Complex amplitude of Gaussian beam, Properties of Gaussian beam-Intensity, power, beam radius, beam divergence, depth of focus, and phase. q –parameter and its properties-beam waist location of the waist, and Radius of curvature of the wave front, Gaussian beam reflection from a spherical mirror, Gaussian beam transmission through an arbitrary optical system, Hermite - Gaussian beams, Laguerre Gaussian and Bessel beams.

Unit III-Transformation of A Gaussian Beam By Lens

Transformation of the q-parameters by a lens system, size of the waist of the emergent beam from a lens, location of the waist of the emergent beam, Rayleigh range of the emergent beam, Angle of the far field divergence of the emergent beam, Beam propagation factor m^2 , The Gaussian beam in spherical mirror cavity, Resonance frequencies of the cavity.

Unit IV-Nonlinear Optics

Nonlinear optical media, Second order nonlinear optics- Second harmonic generation and rectification, Phase matching condition, Difference frequency generation, sum frequency generation, Electro-optic effect- Pockels electro-optic effect, Kerr electro-optic effect, three wave mixing, Third order nonlinear effects-Third harmonic generation (THG) Optical Kerr effect, Self phase modulation, self focusing, Four wavemixing, optical phase conjugation, Degenerate four wavemixing.

Unit V-Semiconductor Photon Detectors

Photodetectors- the p-n photodiode, the p-i-n photodiode, hetero structure photodiodes, array detectors, Properties of semiconductor photo detectors-quantum efficiency, responsivity, and response time, Avalanche photodiodes-principles of operation, Gain and responsivity, Response time, Noise in photodetectors-photoelectron noise, Gain noise, Circuit noise, signal to noise ratio and receiver sensitivity.

Text Books:

1. Lasers -Theory and Applications – K.Thyagarajan and A.K. Ghatak (MacMillan)
2. Fundamentals of Photonics- Bahaa E Saleh.
3. Elements of Photonics, Volume 1-Keigo Izuka

4. Laser fundamentals – William T. Silfvast (Cambridge)
5. Optical Electronics – Ajoy Ghatak and K.Thyagarajan (Cambridge)

Course Outcomes:

- Learns about the different line broadening mechanisms and q-switching method and mode locking in lasers to get the pulsed operation of lasers
- Basics of Gaussian beam profile of a laser beam and their characteristics further conversion of Gaussian beam into other types such as Bessel, Laguerre beams.
- Introduce q-parameters of the lens system and the transformation of Gaussian beam in a lens system, design of resonating cavity of the laser and for different resonance frequencies.
- Introduction to the nonlinear optical phenomena with reference to the non linear optical materials.
- Different methods like electro-optic effect, four wave mixing, self-focusing, phase conjugation will be learned thoroughly.
- Concepts of the photo detector, semiconductor diode detector, principles of operation, efficiency noise level of the photo detector will be understood.

M.Sc. PHYSICS III - SEMESTER SPH 845 RADIATION PHYSICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: The Radiation physics is one of the core branches of physics dealing with the understanding of different types of radiations, their origin, properties, detection and the applications in various fields of technology.

Objective: Introducing the concept of radiation and its interaction with matter, measurement of radiation using various detectors and its protection.

Unit - I

Introduction to Radiations

Types of radiation – electromagnetic spectrum – atomic and nuclear structure – nuclear forces – x-rays- Radioactivity– nuclear transformation – nuclear reactions– production of radioactive materials – radioactive decay – half- life, mean life – transient sector equilibrium - Radioisotopes in medicine and health care.

Unit - II

Interactive of Radiation with Matter

Photo electric effect, Compton effect and pair production,– attenuation and absorption of radiation – exponential law– half value layer – interaction of charged particles – neutron interactions– optical interactions – ultrasound interactions.Radiation detectors –principles of radiation detection– ionization chamber, proportion counter, GM tubes, semiconductor detector, gamma ray spectrometer.

Unit - III

Radiation Dosimetry

Radiological units and their measurement – Curie, Roentgen Gray, RAD and Sievert –

applications of units in radiological safety – Exposure rate, Dose rate, air kerma, tissue air ratio (TAR) – percentage depth dose (POD), tissue maximum ratio (TMR) – dose limits Measurement of exposure and dose – internal dosimetry and external dosimetry – doses from various sources of radiation - Film badges - TLDS

Unit - IV

Environmental impact of radioactivity and radioisotopes

Biological effects of radiation, cosmic radiation and cosmogenic radionuclides- naturally occurring long-lived radionuclides – Radon and its decay products – Environmental impact of uranium industry – Nuclear Energy and the environment – Other man made radiation sources in the environment – radioactive wastes

Unit - V

X-rays and x-ray machines

Cobalt therapy units - quality assurance and calibration of therapy units, Basics of NMR and MRI, nuclear medicine x-ray machines – cobalt therapy units - quality assurance and calibration of therapy units. Nuclear medicine – Invitro and Invivo - SPECT, PET, Radiation protection – ICRP frame work of radiological protection – measures of radiation protection – special facilities for handling radioisotopes

Text Books:

1. Physics of Radiation Therapy by F.M.Khan, 3rd Edition, Lippincott Williams & Wilkins
2. Basic medical radiation physics by Stanton, Appleton-Century-Crofts
3. Fundamentals of Radiochemistry by D.D.Sood, A.V.R.Reddy and N.Ramamoorthy, IANCAS Publication, 3rd edition, BARC, Mumbai.
4. Source book on Atomic energy by Samuel Glasstone, Affiliated East-West Press Pvt.Ltd

Course Outcomes:

- To be aware of the electromagnetic spectrum, classification of the EM spectrum based on energy of radiation and the origin of each type of radiation.
- To Know the phenomena of Radioactivity in nuclear materials, the related terms like Half life time, mean life and the applications of radioisotopes in medicine/ healthcare systems.
- To understand the interactions of radiation with matter and phenomena like photoelectric effect Compton effect and pair production.
- To understand the construction and working of Radiation detectors.
- Quantifying and analysis of the radiation measurements with the impact of radiations on environment and safety measures.
- Details of Uranium industry and other man made radiation sources in the environment with study of X-rays, X-rays machines and importance in the field of medical instrumentation.
- To understand techniques NMR and MRI.

M.Sc. PHYSICS III - SEMESTER SPH 847 DYNAMICAL SYSTEMS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: This course focusses on dynamics of differential equations of different order,

Hamiltonian dynamics along with Lagrangian formulation, basics and advancements of perturbation theory, chaotic Hamiltonian systems and the complications in their mapping, and nonlinear evolution of systems

Objective: To introduce the non linear phenomena of physical systems and its relevance to natural phenomena with simple models.

Unit- I

Dynamics of Differential Equations

Introduction to systems, Integrations of linear second order equations, Integration of non linear second order equations, Dynamics of phase plane, linear stability analysis, time dependent integrals and non autonomous systems.

Unit- II

Hamiltonian Dynamics

Lagrangian formulation of mechanics, Hamiltonian formulation of mechanics, canonical transformations, Hamilton Jacobi equations and action angle variables, and integrable Hamiltonians.

Unit- III

Classical Perturbation Theory

Elementary perturbation theory, canonical perturbation theory, many degrees of freedom and problem of small divisors, Kolmogorov –Arnold-Moser theorem and its invariants.

Unit- IV

Chaos in Hamiltonian Systems and Mappings

Surface of section, Area preserving mapping, fixed points and the Poincare-Birkhoff -Fixed point theorem, Homoclinic and Hetroclinic points, criteria for local chaos, criteria for onset and wide spread chaos, statistical concepts in chaotic systems and Hamiltonian chaos in fluids.

Unit -V

Nonlinear Evolutions

Dynamics of dissipative systems and turbulence, experimental observations and theories on onset of turbulence. Basic properties of KdV equation, inverse scattering transform-basic principles, Inverse scattering transform KdV equation, Hamiltonian structure of integrable systems, soliton systems and Dynamics of non integrable evolution equations.

Text Books:

1. Chaos and Integrability in Non-linear Dynamics M. Tabor (Wiley), 1989
2. Chaos: An Introduction to Dynamical Systems (Textbooks in Mathematical Sciences) Kathleen T. Alligood , Tim D. Sauer & James A. Yorke Springer, 2nd Ed.
3. Regular and stochastic motion Lichtenber & Leiberman, Springer, 2nd Edition, 1992
4. Chaos in Gauge Theories by Biro Muller (World Scientific), 1995

Course Outcomes

- Introduces the fundamental differential equations and integration of nonlinear second order equations.
- Enables the basic understanding the formalisms of Lagrangian and Hamiltonian
- Improve the awareness about the link of classical and quantum mechanics
- Focusses on the understanding of perturbation and various orders of it.
- Improves the understanding of chaotic systems and the difficulties Hamiltonian formalism for chaotic liquids
- Targets the dynamics of dissipative systems and related turbulence.
- Enables the mathematical formalisms of scattering, soliton systems

M.Sc. PHYSICS III – SEMESTER
SPH 849 MODERN OPTICS AND LASER SPECTROSCOPY

Hours per week: 4

End Examination: 60 Marks

Credits: 4

Sessionals: 40 Marks

Preamble: This course introduces the optical fibers and their working principle, optical phenomenon based on Fourier analysis, Physics behind the laser, resonators, and various pulsed and continuous lasers.

Objective: Introductory aspects of Modern optics for mode propagation and amplification.

Unit- I

Fiber optics and Holography

Basic Characteristics of optical fiber, Ray and modal analysis of single and multimode fibers (Step index and graded index), Graded Index fiber, Single and Multimode fibers, material dispersion, Fiber losses, Holography.

Unit-II

Fourier Optics

Propagation of light in free space-spatial harmonic functions and plane waves, Spatial spectral analysis, Amplitude modulation, Transfer function of free space, Frequency modulation, Impulse response function of free space, Huygens-Fresnel's principle, Optical Fourier transforms-Fourier transform in the far field, Fourier transform using lens, Diffraction (Fourier treatment).

Unit-III

Light Amplification

Einstein coefficients, absorption and emission cross sections, Light amplification, Threshold condition, Line broadening mechanisms–natural, collisional, Doppler broadenings, Quantum theory of evaluation of Einstein's coefficients, rate equations for 2-level, 3-level, 4-level systems, Variation of laser power around threshold.

Unit- IV

Optical Resonators

Modes of a rectangular cavity, Spherical mirror resonators, Q factor, Line width of a laser, Mode selection-transverse and longitudinal modes, pulsed operation of lasers-Q switching, Mode locking, Techniques for Q switching and mode locking.

UNIT –V

Laser Systems

Ruby laser, He-Ne Laser, Semiconductor laser, Nd:YAG and Nd: Glass laser, Ti: Sapphire laser, CO₂ lasers and Ar ion lasers, Fiber laser, Dye lasers.

Text Books:

1. Lasers fundamentals and applications K. Thyagarajan, Ajoy Ghatak

2. Introduction to Photonics, B. E. A. Saleh
3. Quantum Electronics A. Yariv

Course Outcomes:

- Learns about the basic principles and applications of fiber optics and holography. Understands the concepts behind the optical fiber communications. Understands the communications using optical fibers
- He/she learns about the frequency modulation in optical fiber communication. He/she learns about the process of light amplification in different level laser systems
- The basics in the light amplifications process, Einstein's coefficients will be understood. Learns the the basics of laser resonators.
- The techniques for the pulsed operation of lasers like Q switching mode locking will be understood. The working and construction of different types of laser systems will be understood.
- The operation of He Ne, Ruby, Ti: sapphire lasers will be learned

M.Sc. PHYSICS III – SEMESTER SPH 851: VACUUM SCIENCE AND TECHNOLOGY

Hours per week: 4 ***
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Course objective: The main objective of this course to know the basic fundamental principles involved for the production of vacuum , working principles of vacuum pumps, gauges , vacuum component and materials used in vacuum system

UNIT- I: INTRODUCTION TO VACUUM SCIENCE

Vacuum principles: Basic concepts of Vacuum; Kinetic theory of gases; Gas laws, Pressure ranges; Types of flow; Flow calculations, Conductance, Pumping speed and pumping time

Vacuum generation: Production of vacuum, Types of Vacuum pumps, Diaphragm pump, Rotary vane pump, Diffusion Pump, Turbomolecular Pump (TMP), Sorption pumps: Adsorption pumps, Sublimation pumps, Sputter-ion pumps; Cryo Pump.

UNIT-II: MEASUREMENT OF LOW PRESSURES

Direct and Indirect pressure measurement vacuum gauges- McLeod gauge – Diaphragm gauge, Thermal conductivity (Priani) guage, Ionization vacuum gauges: penning guage, Hot cathode ionization guage, Bayard-Alpert ionization guage, Calibration of vacuum gauges, Mass flow meters and controllers, Analysis of gas at low pressures: Residual gas analyzers, Quadrupole mass spectrometer

UNIT-III: LEAK DETECTION AND TESTING METHODS

Types of leaks, Leak rate, Real leak, Virtual leak, Leak detection and test methods: Pressure rise and drop tests, Tests using vacuum gauges, Bubble immersion test, Pressure test, Foam- spray test, Halogen and Helium leak detectors.

UNIT-IV: VACUUM MATERIALS AND COMPONENTS

Introduction to vacuum materials, classification of vacuum materials, Cleaning procedures for materials in ultrahigh vacuum, Design and Fabrication of vacuum chambers, flanges,

couplings, and components for different applications. Stainless steel, copper OHFC, Aluminium and ceramic vacuum components.

UNIT-V: PROCESS AND APPLICATIONS OF VACUUM TECHNOLOGY

High-Vacuum-Based Processes: Brief overview on Sputtering, Plasma etching, Ion beam technology and pulsed laser deposition. Applications of vacuum technology in High energy particle accelerators, Synchrotrons, Semiconductor Industry, Fusion experiments, Analytical instruments.

Text books:

1. Vacuum Technology, A. Roth, North Holland, Elsevier Science B.V. 1990.
2. Handbook of vacuum science and technology, Dorothy M. Hoffman, Bawa Singh, John H. Thomas, III, Academic press limited, San Diego, USA, 1998
3. A User's Guide to Vacuum Technology (Third Edition), John F. O'Hanion, John Wiley & Sons, Inc., New York, United States, 2003.
4. Vacuum Science and Technology, V. Vasudeva Rao, T.B. Ghosh and K.L. Chopra, Allied .Publications, New Delhi, India, 1998.
5. Introduction to Vacuum technology, Dr. A. K. Bhusan, Indian Vacuum Society, BARC, Mumbai, 2013.

Course outcomes: The student will be able

1. To apply the kinetic theory of gases and basic rules of vacuum science in the design of gas transport and to know the working principles of different vacuum pumps.
2. To know the operation range of vacuum gauges used for the measurement of low pressures.
3. To know the principles of leak detectors and measurement of leak using leak detectors for troubleshooting the vacuum system.
4. To know the materials and components used for the fabrication and design of vacuum systems.
5. To have an overview over the role of vacuum equipment in modern industrial process and particularly in semiconductor industry.

M.Sc. PHYSICS III – SEMESTER

Hours Per week: 4

Credits: 4

End Examination: 60 Marks

Sessionals: 40 Marks

SPH 853: Molecular Mechanics

Unit 1: Concepts in Molecular Modeling

Introduction, Coordinate Systems, Potential energy surfaces, Molecular graphics and Surfaces of modeling

Unit 2: Computational Quantum Mechanics

Introduction, One electron atoms, Polyelectronic atoms and molecules, Molecular orbital calculations, The Hartree Fock equations, Basis sets, Calculating molecular properties using ab initio Quantum mechanics, Approximate molecular orbital theories, Huckel Theory, Performance of Semi-empirical Methods

Unit 3: Computational Methods of Systems

Introduction, Open – shell systems, Electron Correlation, Practical Considerations when performing ab initio Calculations, Energy Component Analysis, Valence Bond Theories, Density Functional Theory.

Unit 4: Empirical Force Field Models

Introduction, Some general features of Molecular Mechanics Force Fields, Bond Stretching, Motions, Cross Terms: Class 1, 2 and 3 Force Fields, Introduction to Non-bonded Interactions, Electrostatic Interactions, Vander Waals Interactions.

Unit 5: Many Body Systems

Effective pair potentials, hydrogen bonding in molecular mechanics, force field models for simulation of liquid water, united atom force field, derivatives of molecular mechanics energy functions, calculation of thermodynamic potentials, force field parametrisation, force field of inorganic molecules and solid state systems.

Text Books

1. Molecular Modeling Principles and Applications, Andrew R. Leach, 2nd ed. PHI
2. Essentials of Computational Chemistry Theories and Models, Christopher J. Cramer, John Wiley.

Course outcomes

1. formulate the basis for and the most important approximations in key molecular computational models.
2. Choose computational model in various chemical problems.
3. Apply modern molecular-level software on presented problems.
4. Assess computational results critically.
5. Understand how to optimize different molecular structures

OPEN ELECTIVE M.Sc. PHYSICS III - SEMESTER SOE 865 BIOPHYSICS

Hours per week: 3

Credits: 3

End Examination: 60 Marks

Sessionals: 40 Marks

Preamble: Relevance of physical principles associated for various process in human body

Objective: To make familiar with biological phenomena with physical principles.

Unit- I

Energy Around Us

Forms of energy, ambient energy, molecular energy, molecular energy absorbance, molecular transduction, ionizing radiation, magnetic resonance and sound, Molecular contacts- Dissociation constants, methods of measuring dissociation constants, metal molecular coordination bond and hydrogen bonding.

Unit- II

Diffusion and Direct Transport

Forces and flows, Ficks law of diffusion, Brownian motion, physical diffusion of ions and molecules, molecular motors and intracellular cargo transport. Energy production of ATP and ADP, phosphocreatine and glycolysis

Unit- III

Force and Movement

Skeletal length and tension relation, muscle contraction, cardiac and smooth muscle length-tension relation, Hill formalism of cross bridge cycle, muscle shortening, lengthening and power, calcium dependence of muscle velocity, smooth muscle latch, muscle tension transients and law of Laplace for hollow organs.

Unit -IV

Load Bearing and Fluid Flow

Stress and strain, teeth and bone, blood vessels, tendons, ligaments and cartilage. Fluid flow properties, synovial fluid flow, arterial blood flow, arteriole blood flow, viscosity and hematocrit, arterial stenosis, arterial asymmetry and lung air flow

Unit -V

Biophysical Interfaces

Surface tension, action of surfactant on lung surface tension, membrane lipids, membrane curvature, membrane protein and carbohydrate environment, membrane protein transporters, membrane organization, ultrasonic pore formation, membrane diffusion and viscoelasticity and membrane ethanol effects.

Text Books:

1. Biophysics(A Physiological approach), Patrick.F.Dillon, Cambridge University Press,2012
2. Biophysics by An introduction, Rodney Cotterill ,Wiely,2002
3. Biophysics by Daniel Goldfarb, Mc Graw Hill,2011

Course Outcomes:

- To attribute energy around us of biological importance
- To understand various transport phenomena for energy production
- To understand the force and movement and their dependence in humans
- To understand various properties related to load and fluid in human body
- To interpret biophysical phenomena across the interfaces.

OPEN ELECTIVE M.Sc. PHYSICS III - SEMESTER SOE 867 BIOELECTRONICS

Hours per week: 3

Credits: 3

Preamble: Analyze sensing elements for biological activity

End Examination: 60 Marks

Sessionals: 40 Marks

Objective: To measure, analyze and interpret and present the data of living systems with working knowledge of electronic components related to biomedical devices and how these are different from traditional electronics.

Unit – I-Introduction to Sensors

Sensors, Nose as sensor, sensors and biosensors, components of biosensors, Aspects of sensors- Recognition elements-transducers, methods of immobilization, performance factors. Biocatalysis and bioaffinity based sensors, Advantages and limitations of biosensors and areas of application.

Unit –II-Transduction Elements

Electrochemical Transducers, Potentiometry and ion selective electrodes-Nernst equation, cells and electrodes, reference electrodes and quantitative relationships (with N.E). Voltametry -Linear sweep and cyclic, Amperometry- kinetic and catalytic effects, Conductivity, Photometric sensors-optical techniques, optical transducers-device construction, solid phase

absorption label sensors and applications.

Unit – III-Sensing Elements

Ionic recognition-ion selective electrodes, interferences, conductive devices, Modified electrodes and screen printed electrodes. Molecular recognition-chemical Recognition agents-thermodynamic complex formation, kinetic catalytic effects. Biological recognition agents-Enzymes, tissues, antibodies and nucleic acids Immobilization- adsorption and microencapsulation.

Unit – IV-Performance Factors

Introduction, Selectivity-ion selective electrodes, enzymes and antibodies. Sensitivity-linear range and detection. Time factors-response factors, recovery and life times.

Precision and accuracy. Different transducers-urea, amino acid and glucose biosensors, factors affecting performance of sensors-amount of enzyme, immobilization method and pH.

Unit – V-Electrochemical Sensors and Biosensors

Potentiometric sensors-ionic selective electrodes-concentration and activities, calibration graph. Potentiometric Biosensors-pH linked, ammonia linked, carbon dioxide linked and iodine selective. Amperometric sensors-Direct electrolytic methods. Conductometric and biosensors-chemiresistors, biosensors based on chemiresistors and semi conductive oxide sensors.

Text Books:

1. Chemical Sensors and Biosensors by Brain R.Eggins Wiley Publishers, 1st Edition
2. Biosensors: fundamentals and applications by Anthony P. F. Turner, Isao Karube, George S. Wilson Oxford University Press, 1987
3. Molecular Bioelectronics by C.Nicolini World Scientific,1996

Course Outcomes:

- Understanding sensors and various types of biological sensors
- Introduction to energy conversion elements.
- Analyze sensing elements for biological phenomena
- Measurement of sensing elements
- Understanding electrochemical and biosensors of biological relevance

OPEN ELECTIVE M.Sc. PHYSICS III – SEMESTER SOE 869 ENVIRONMENTAL PHYSICS

Hours per week: 3

Credits: 3

End Examination: 60 Marks

Sessionals: 40 Marks

Preamble: To realize the importance of environment and its relevance to biological phenomena.

Objective: Application of physical concepts to earth system, with focus on human systems, water, ground, ozone and fossil fuels

Unit-I

Introduction to Environmental Physics

The human environment: First, Second and Third law of Thermodynamics, Energy and metabolism - Laws of thermodynamics and the human body
Energy transfers: Conduction, Convection, Newton's law of cooling, Radiation, Evaporation, Survival in cold climates, Survival in hot climates
Noise pollution: Domestic noise and the design of partitions

Unit-II

Water

Hydrosphere, Hydrologic cycle, Water in the atmosphere, Clouds, Physics of cloud formation, growing droplets in cloud, Thunderstorms

Wind: Measuring the wind, Physics of wind creation, Principal forces acting on air masses, Gravitational force, Pressure gradient, Cyclones and anticyclones, Global convection, Global wind patterns.

Unit-III

Physics of Ground

Soils, Soil and hydrologic cycle, Surface tension and soils, Water flow, Water evaporation, Soil temperature. Environmental Biophysics -Energy budget concept, radiation energy fluxes, energy equilibrium between biotic and abiotic environmental components, Ozone layer depletion – Greenhouse effect

Unit-IV

Fossil Fuels

Nuclear power, Renewable resources – Hydroelectric power, Tidal power, Wind power, Wave power Biomass, Solar power – Solar collector, Solar photovoltaic Energy demand and conservation – Heat transfer and thermal insulation – Heat loss in buildings

Unit-V

Environmental Impact of Radioactivity and Radioisotopes

Biological effects of radiation, cosmic radiation and cosmogenic radionuclides- naturally occurring long-lived radionuclides – Radon and its decay products – Environmental impact of uranium industry – Nuclear Energy and the environment – Other man made radiation sources in the environment – radioactive waste.

Text Books:

1. Environmental Physics by E. Boeker & R. Van Grondelle, John Wiley & sons, 1994
2. Concepts of Modern Physics by Beiser McGraw Hill, 5th Edition
3. The nature and properties of Soils by Brady, N.C. Tenth Edition. Mac Millan Publishing Co., New York, 1990
4. Environmental Studies: The earth as a living planet by Botkin, D.B and Kodler E.A., John Wiley and Sons Inc., 2000
5. Environmental Physics by M. Dželalija

Course Outcomes:

- Understanding environment and thermodynamics of human body in relation to energy
- Understanding water, wind for its formation and measurement.
- Understanding the physics of soils
- Understanding fossil fuels and transfer of heat
- Understanding the impact of radioactivity for biological phenomena

M.Sc. PHYSICS III – SEMESTER
SPH 821 ANALOG AND DIGITAL COMMUNICATION LAB

Hours per week: 6
Credits: 3

Continuous Evaluation: 100 Marks

Objective: Understanding the design of communication circuits with electronic devices and
MATLAB

1. Amplitude Modulation (Implementation with Circuit and Software)
2. Detection of Amplitude Modulation (Implementation with Circuit and Software)
3. Frequency Modulation (Implementation with Circuit and Software)
4. Pulse Width Modulation (Implementation with Circuit and Software)
5. Pulse Position Modulation (Implementation with Circuit and Software)
6. Amplitude Shift Keying
7. Phase shift Keying
8. Frequency shift keying
9. Phase locked loop
10. Mixer

Course Outcomes:

1. Demonstrate generation and detection of analog and digital modulation techniques
2. Understand the operations of analog and pulse modulation & demodulation techniques
3. Design of communication circuits for continuous and pulse modulation methods
4. Acquire knowledge on MATLAB programming skills to simulate analog and pulse modulation and demodulation techniques
5. Develop the ability to compare and contrast the strengths and weaknesses of various modulation techniques

M.Sc. PHYSICS III - SEMESTER
SPH 825: MODERN OPTICS AND NUCLEAR PHYSICS LAB

Hours per week: 6
Credits: 3

Continuous Evaluation: 100 Marks

Objective: Analyze and visualize Laser light and Radiation from radioactive sources

1. He-Ne Laser –Diffraction Grating
2. Divergence of Laser Beam
3. Optical Fiber- Numerical Aperture and Bending losses
4. Optical Fiber Characteristics

5. Plateau Characteristics
6. Intensity variation of radiation
7. Inverse square law for gamma radiation
8. Absorption Coefficient of material
9. Statistical Aspects of Radiation
10. Beta back scattering factor
11. Dead time and Resolving time

Course Outcomes:

1. understand the physics principles behind the experiments.
2. identify errors in the experiments.
3. understand the functions of components used in the experiments
4. Gained ability to set the proper experimental conditions for the measurement of a physical quantity with a given apparatus
5. Design a measurement involving nuclear or natural radiation
6. Match the type of detector to the intended measurement process

**M.Sc. PHYSICS IV - SEMESTER
SPH 891 Comprehensive Viva**

Credits: 2

Continuous Evaluation: 50 Marks

**M.Sc. PHYSICS IV-SEMESTER
SPH 802: MATERIAL CHARACTERIZATION TECHNIQUES**

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: To measure various physical parameters with different experimental methods.

Objective: To make familiar with various experimental techniques in characterization of materials

Unit- I

Nuclear Techniques

Rutherford back scattering spectrometry, Low energy ion scattering, General picture of energy loss, Energy loss of MeV ions in solids, Comparison of energy loss to electrons and to nuclei, energy loss in compounds- Bragg's rule, The shape of backscattering spectrum, Depth profiles with RBS, Secondary Ion Mass Spectrometry (SIMS).

Unit - II

Spectroscopic Techniques

UV-Visible-NIR spectroscopy, Beer Lamberts law-band gap measurement, Infrared spectroscopy-instrumentation and interpretation of vibrational spectra sample handling techniques, FTIR, Spectroscopic Ellipsometry, Electron spin resonance spectroscopy.

Unit- III

X-ray Techniques

X-ray Absorption, Extended X-ray absorption fine structure (EXAFS), X-ray Photoelectron spectroscopy, Experimental considerations-radiation sources, electron spectrometers, photoelectron energy spectrum, Diffraction of X-rays by crystal, Bragg's Law, X-ray spectrometer, Diffraction directions, diffraction under nonideal conditions-Scherrer equation for the estimation of particle size. Comparison of X-ray scattering by solids, liquids and gases.

Unit - IV

Microscopic Techniques

Transmission electron microscopy (TEM), Thermionic and field emission scanning electron microscopy (SEM), energy dispersive X-ray (EDX) and wavelength dispersive X-ray (WDX) analysis, atomic force microscopy (AFM), Near-field scanning optical microscope (NSOM), Nano-indentation technique.

Unit - V

Magnetic, Thermal and Electrical Analysis Techniques

Vibrating sample magnetometer (VSM), Impedance analyser, closed cycle refrigerator, Thermal Gravimetric Analysis (TGA), Differential thermal analysis (DTA), Differential scanning calorimeter (DSC), four probe method, Basics of I-V and C-V measurements on different materials.

Text Books:

1. Fundamentals of surface and thin film analysis ,L. C. Feldmann and J W Mayer
2. Elements of X-ray diffraction, B D Cullity
3. Nuclear radiation Detectors, V.S.Ramamoorthy and S.S.Kapur
4. Fundamentals of Molecular Spectroscopy , Colin Banwell, Elaine McCash 4th Ed.
5. Introduction to Nano technology, Charles P. Poole Jr. and Frank J. Owens Wiely

Course Outcomes

- Familiarize nuclear experimental techniques for solid state materials
- To analyze infrared spectroscopic techniques to interpret spectra of molecules □
To analyze X ray diffraction spectra for crystalline size
- To analyze different methods for particle size, surface and energy with microscopic methods
- To study various magnetic, thermal and electrical techniques for characterization of materials

SPH 842 INTRODUCTION TO THIN FILM TECHNOLOGY

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessional: 40 Marks

Preamble: An introduction to basic thin film technology techniques, Growth processes, properties and application of thin films.

Objective: To impart knowledge on physical and chemical processes with models for nucleation and growth of thin films.

Unit 1-Thin film deposition techniques

Why thin films?, Vapour deposition techniques, physical vapour deposition- Thermal evaporation, DC, RF, ion beam Sputtering, Chemical vapour deposition, Solution deposition techniques: chemical solution deposition (CSD), electrochemical deposition (ECD). Thick film deposition techniques: Liquid-Phase Epitaxy (LPE), Screen Printing, melt Spinning, Dip Coating, Spinning, and Solution Casting. Monitoring and Analytical Techniques-Deposition Rate and Thickness Measurement.

Unit 2-Nucleation and Growth of thin films

Elastic scattering, thermal accommodation coefficient, motion of adsorbed atoms on surface, surface energy of solids, vapour pressure above a cluster, Mechanisms of thin film formation. 3D nucleation, 2D nucleation, Rate of Nucleation. Atomistic theory of nucleation, Kinetic nucleation theory, coalescence, ripening, film growth and microstructure, Grains in films, stresses in thin films, Ostwald's step rule.

Unit 3-Epitaxy

Relationship between substrate and epitaxial layer, growth morphology, structure and energy of epitaxial interface, strained layer epitaxy, defects in epitaxial layers, diffusion in epitaxial surfaces, Molecular beam epitaxy (MBE) technique.

Unit 4-Properties of thin films

Conducting films, semiconductor films, superconducting films, magnetic films, dielectric films, ferroelectric films, mechanical properties of thin films, optical properties of thin films, diffusion in thin films.

Unit 5-Applications of thin film

Anti-Reflection coatings, Photovoltaic Devices, Solar Cells: General Analysis, Thin Film Solar Cells, Photon Detectors-photoconductive Detectors, Photoemissive Detectors. Thin Film Displays, Thin Film Transistor (TFT), Thin Film Diodes. Charge-Coupled Devices (CCDs): Principle, Applications. Wear-Resistant Coatings, Lubricating Coatings. Decorative Applications.

Text Books:

3. Thin Film Device Applications-K. L. Chopra and Indrajeet Kaur
4. Principles of Vapor Deposition of Thin Films- K.S.SreeHarsha,

Reference Books:

1. Thin Film Phenomena by K L Chopra
2. Material Science of thin films by Milton Ohring

Course outcomes:

- The student will learn the different routes of thin film preparation- Physical Vapor, Chemical Vapor, and solution-based deposition techniques.
- The student will be aware of different process parameters and controlling instruments in thin film deposition.
- Knowledge of different stages of nucleation and growth of thin film techniques will be acquired. A clear understanding of the concept of epitaxy and its importance in controlling the growth and morphology of thin films.
- Gain an ability to study the mechanical, optical, magnetic, dielectric properties of thin films
- The student acquires an understanding of the broad scope of applications of thin films in different fields.

M.Sc. PHYSICS IV-SEMESTER
SPH 846: SOFT CONDENSED MATTER PHYSICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: Aims in study of deformable materials for critical phenomena.

Objective: Understanding the knowledge of easily deformed materials with thermal fluctuations and mechanical stresses for critical phenomena.

Unit- I

Concepts of Condensed Matter

Gaseous and liquid states, liquid gas phase transition, spatial correlation, ice-crystallized water, broken symmetry and rigidity, Dislocations- topological defects. Universality of water, Energies and potentials-Energy scales, vanderwaal attraction, Molecular Hydrogen-Heitler London approach and hard sphere repulsion.

Unit -II

Structure and Scattering

Elementary scattering theory, photons, neutrons and electrons, density operator and correlation functions, hard sphere liquids. Crystalline solids-unit cells and direct lattice, reciprocal lattice, periodic functions and Bragg scattering. Symmetry and crystal structure- two and three dimensional bravice lattice and close packed structures.

Unit- III

Thermodynamics of Homogenous fluids

Laws of thermodynamics, thermodynamic potentials, stability criteria, homogenous function and equation of state, Ideal gas, spatial correlation in classical systems, ordered systems, Symmetry, order parameter and models- discrete symmetries and continuous symmetries and models

Unit- IV

Mean Field Theory

Bragg William theory, landau theory, Ising and n vector models-non local susceptibility and correlation length. Liquid gas transition-critical point and critical isochore, coexistence curve. Liquid-Solid transition- Are all crystals BCC, Criterion for freezing, changes in density and density fluctuation theory.

Unit- V

Critical Phenomena

Variational mean field theory-two inequalities, mean field approximation, Break down of mean field theory - mean field transition revisited. self consistent field approximation. Critical exponents, Universality and scaling-exponents and scaling relations, scaled equation of state, multi critical points, amplitude ratios, calculation of critical exponents and amplitude ratios.

Text Books:

1. Principles of Condensed Matter Physics
P.M.Chaikin and T.C Lubensky Cambridge Univ. Press ,2000
2. Advanced Condensed matter Physics
Leonard .M. Sander Cambridge Univ. Press Edition, 2009

Course Outcomes

- Introduction to the concept of condensed matter and reason for formation of condensed matter is understood with different approaches for condensed matter for determination of energies and potential is realized.
- Formation of structure with inherent concept of lattice is familiarized.
- Scattering phenomena of crystal structures if understood in two and three dimensions

- Homogeneity of fluid with equation of state is understood
- Spatial correlation of fluid for symmetry and order parameter is understood

- Understands the various theories of condensed matter for its properties
- Enables to understand the transitions during condensed matter.

- Understand the critical phenomena of condensed matter
- Gain knowledge of condensed matter during transition for specific parameters during transition

M.Sc. PHYSICS IV - SEMESTER SPH 848: ADVANCED THEORIES IN FERROICS

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: This course introduces the ferroic properties of materials and their applications for devices. This course is mainly aims for materials science researchers

Objective: Introduce the new and advanced functional ferroic materials with their synthesis and properties.

Unit-1-Ferroics

Introduction, Ferroelectric materials, Crystal structures and space groups, Ferromagnetic materials, Magnetoelectric effects, Incompatibility between ferroelectricity and magnetism, Mechanisms for ferroelectric and magnetic integration, Ferroelasticity, Ferroelastic materials.

Unit-II-Ferroelectric orders

Barium titanate: theory, Formation and Dynamics of Domains, phase transitions and critical phenomenon, Antiferroelectric Transition, Piezoelectric Phenomena, Piezoelectric Materials

Pyroelectric Phenomena, Pyroelectric Materials, Dielectrics - Time-Domain Approach and the Frequency-Domain Approach, Complex Permittivity, Debye Equations.

Unit-III-Magnetic orders

Exchange interactions, Anisotropies in [100], [110] and [111] directions, Domains: size, shape and motion. Bloch wall, Magnetization processes, Molecular field theory of antiferromagnetism, Types of antiferromagnetism, Ferrimagnets, Frustration, Spin glasses, Crystal field effects, Rare-earth ions and the electrostatic potential, ligand fields, Transition- metal ions-The Jahn-Teller effect, Quenching of the orbital angular momentum.

Unit-IV-Magnetoelectric coupling

Magnetoelectric materials, magnetoelectric coupling, Multiferroics, Type-1 and Type-2 multiferroics, Approaches to the coexistence of ferroelectricity and magnetism, Independent systems, Ferroelectricity induced by lone-pair electrons, Geometric ferroelectricity in hexagonal manganites, Spiral spin-order-induced multiferroicity, magnetoelectric coupling.

Unit-V-Applications of Ferroics

Magnetic field sensors using multiferroics, Electric field control of exchange bias by multiferroics: Exchange bias in CoFeB/BiFeO₃ spin-valve structure, Exchange bias in Py/YMnO₃ spin-valve structure, Multiferroics/semiconductor heterostructures as spin filters, Four logical states realized in a tunnelling junction using multiferroics, Negative index materials.

Text Books:

1. Dielectric phenomena in solids ,Kwan Chi Kao, Elsevier Academic Press,2004
2. Ferroelectricity ,Julio A. Gonzalo, Basilio Jirntnez, Wiley-VCH Verlag GmbH & Co 2005.
3. Magnetism and Magnetic materials J. M. D. Coey, Cambridge University Press, 2009.
4. Multiferroicity: the coupling between magnetic and polarization orders, K.F. Wang, J.-M. Liu and Z.F. Ren, Advances in Physics, **58**, No. 4, 321–448, 2009

Course outcomes:

- Various types of ferroics will be understood. Incompatibility between ferroelectricity and magnetism in materials will be understood. Piezoelectric, Piezoelectric, Pyroelectric materials properties are understood
- Some basics on Dielectrics, Debye equation are understood. About Exchange interactions, Anisotropies and Domains are understood
- About ligand fields, The Jahn-Teller effect and Quenching are understood. About Magnetoelectric, Multiferroics are learnt
- Different types of origin of ferroelectricity are understood. About Magnetic/electric field sensors are learnt
- About spin-valve structure, Multiferroics/semiconductor heterostructures are learnt.

SPH 850 ULTRAFAST OPTICS AND RAMAN SPECTROSCOPY

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessional: 40 Marks

Preamble: Understand the knowledge of nonlinear optical phenomena for its generation, measurement and its measurement

Objective: Understand the knowledge of nonlinear optical phenomena, the generation and measurement of ultrashort pulses.

Unit I - Methods for the generation of ultrashort laser pulses: Mode locking

Optical pulses, relation between pulse duration and spectral width, Methods for the Generation of Ultrashort Laser Pulses- Mode-Locking, Principle of the Mode-Locked Operating Regime The Active Mode-Locking Method.

Unit II-Pulse Measurements

Introduction, Energy Measurements, Power Measurements, Measurement of the Pulse Temporal profile, Spectral Measurements, Amplitude–Phase Measurements.

Unit III- Spectroscopic Methods for Analysis of Sample Dynamics

Pump–Probe” Methods, General Principles, Probe-Induced Raman Scattering, Time-Resolved Emission Spectroscopy: Broad-Bandwidth Photo detectors, Transient-Grating Techniques, Principle of the Method: Degenerate Four-Wave Mixing (DFWM)

Unit IV-Ultrafast laser ablation

Nonlinear optical media, Second order nonlinear optics-second harmonic generation and rectification, phase matching condition, difference frequency generation, sum frequency generation, electro-optic effect, Pockels electro-optic effect, Kerr electro-optic effect, three wave mixing, third order nonlinear effects,-Third harmonic generation,, self-phase modulation, self-focusing

Unit V-Raman spectroscopy

Introduction, Absorption and Scattering, States of a System and Hooke’s Law, The Nature of Polarizability and the Measurement of Polarization, The Basic Selection Rule, Number and Symmetry of Vibrations, the Mutual Exclusion Rule, The SERS-surface Plasmon resonances, electromagnetic and chemical enhancement, Enhancement factor (EF).

Text Books:

1. Femtosecond laser pulses –principals and experiments - Claude Rulliere
2. Fundamentals of photonics, Bahaa E Saleh
3. Modern Raman Spectroscopy – A Practical Approach, Ewen Smith, Glasgow Geoffrey Dent

Course outcomes:

- Students procured knowledge on ultrashort pulses. obtained exposure on generation mechanisms of ultrashort laser pulses. Understand the basic properties of ultrashort pulses.

- Understand how time domain and frequency domain information of pulses is related. Acquired exposure on time resolved studies
- To know how micro level information of molecules will be probed by ultrashort pulses. Understood the intensity role of ultrashort pulses in determining optical nonlinearities.
- Learned nonlinear optical phenomenon which gave birth to many advanced laser systems. Raman scattering and its basic idea is understood.
- Learned other techniques such as SERS which eliminates the poor scattering cross section.

M.Sc. PHYSICS IV-SEMESTER SPH 852: MATERIALS SCIENCE

Hours per week: 4
Credits: 4

End Examination: 60 Marks
Sessionals: 40 Marks

Preamble: Aims in understanding the different phenomena of materials science.

Objective: To impart knowledge in understanding crystals structures, classification, synthesis and phase transitions in different types of materials.

Unit- I

Applied Crystallography in Materials Science

Noncrystalline and semicrystalline states, Lattice, Crystal systems, unit cells. Indices of lattice directions and planes. Coordinates of position in the unit cell, Zones and zone axes. Crystal geometry. Symmetry classes and point groups, space groups. Glide planes and screw axes, space group notations, Equivalent points. Systematic absences, Determination of crystal symmetry from systematic absences. Stereographic projections. Standard projection of crystals.

Unit- II

Introduction to Materials Classification of Materials

Crystalline & amorphous materials, high T_c superconductors, alloys & composites, semiconductors, solar energy materials, luminescent and optoelectronic materials, Polymer, Liquid crystals and quasi crystals, Ceramics.

Unit- III

Preparation Techniques of Materials

Preparation of materials by different techniques: Single crystal growth, zone refining, epitaxial growth. Melt-spinning and quenching methods, sol-gel, polymer processing. Preparation of ceramic materials; Fabrication, control and growth modes of organic and inorganic thin films: different technique of thin film preparations: Basic principles.

Unit-IV

Synthesis of Nanomaterials

Top down and bottom up approaches of synthesis of nano-structured materials, nanorods, nanotubes/wire and quantum dots. Fullereness and tubules, Single wall and multiwall nanotubes

Unit- V

Phase Transition in Materials

Solid solutions, Phases, Thermodynamics of solutions, Phase rule, Binary phase diagrams, Binary isomorphous systems, Binary eutectic systems, ternary phase diagrams, kinetics of solid reactions. Order disorder phenomenon in binary alloys, long range order, super lattice, short range order.

Reference Books

1. Materials science and Engineering V. Raghavan, Prentice-Hall Pvt. Ltd.
2. Thin Solid Film, K. L Chopra
3. Elements of X-ray diffraction, B. D. Cullity, Addison-Wesley Publishing Co.
4. Elements of crystallography, M. A. Azaroff
5. Engineering Materials by Kenneth G. Budinski, Prentice-Hall of India Pvt. Ltd.

Course outcomes:

- Enable to understand the realization of crystals with crystallographic parameters. Introduces the symmetry of crystals, point and space groups of crystals. Introduces the classifications of materials
- Concept of liquid crystals and its classification are understood. Aims in preparation of materials with different methods.
- Fabrication and growth modes of thin films are understood. Helps to understand the synthesis of nanomaterials
- Idea of fullerenes and nanotubes were understood. Helps to understand the phase diagrams of importance. Understands the ordering phenomena of binary alloys.

M.Sc. PHYSICS IV - SEMESTER

SPH 822 MATERIAL CHARACTERIZATION LAB

Hours per week: 6

Continuous Evaluation: 100 Marks

Credits: 3

Objective: Ability to understand the interpretation of various characterization data/spectra

1. Interpretation of Fourier transform infrared spectroscopy (FTIR) spectra
2. Interpretation of UV Vis spectra
3. Analysis of XRD pattern
4. Vibrational Raman spectra
5. TEM data -Average particle size measurement
6. SEM data Microstructure analysis
7. Electron Spin Resonance
8. Gamma ray spectrometer

9. Spectroscopic Ellipsometry

10. Identification of textures using Optical Polarizing Microscope

Course outcomes:

- 1.Ability of performing basic characterization of materials for morphological properties of materials.
- 2.Tests for the investigation of the thermal properties of materials
- 3.Tests for the identification of functional and fingerprint regions of molecules of interest.
- 4.Perform calculation of different parameters from database provided
- 5.Ability to grasp the physical properties form spectra

**M.Sc. PHYSICS IV - SEMESTER
SPH 892 PROJECT WORK**

Hours per week: 6
Credits: 8

Continuous Evaluation: 200 Marks
